

# BBM 102 – Introduction to Programming II

Spring 2017

## Collections Framework

*Instructors:* Ayça Tarhan, Fuat Akal, Gönenç Ercan, Vahid Garousi

1

## java.util.Arrays

- Provides high-level static methods for manipulating arrays, such as:
  - **sort** for sorting an array,
  - **binarySearch** for searching a sorted array,
  - **equals** for comparing arrays
  - **fill** for placing values into an array

3

## Arrays – Example

```
3 import java.util.Arrays;
4
5 public class UsingArrays
6 {
7     private int intArray[] = { 1, 2, 3, 4, 5, 6 };
8     private double doubleArray[] = { 8.4, 9.3, 0.2, 7.9, 3.4 };
9     private int filledIntArray[], intArrayCopy[];
10
11    // constructor initializes arrays
12    public UsingArrays()
13    {
14        filledIntArray = new int [ 10 ]; // create int array with 10 elements
15        intArrayCopy = new int [ intArray.length ];
16
17        Arrays.fill( filledIntArray, 7 ); // fill with 7s
18        Arrays.sort( doubleArray ); // sort doubleArray ascending
19
20        // copy array intArray into array intArrayCopy
21        System.arraycopy( intArray, 0, intArrayCopy,
22                          0, intArray.length );
23    } // end UsingArrays constructor
```

2

4

## Arrays – Example (continued)

```
47 // find value in array intArray
48 public int searchForInt( int value )
49 {
50     return Arrays.binarySearch( intArray, value );
51 } // end method searchForInt
52
53 // compare array contents
54 public void printEquality()
55 {
56     boolean b = Arrays.equals( intArray, intArrayCopy );
57     System.out.printf( "intArray %s intArrayCopy\n",
58         ( b ? "==" : "!=" ) );
59
60     b = Arrays.equals( intArray, filledIntArray );
61     System.out.printf( "intArray %s filledIntArray\n",
62         ( b ? "==" : "!=" ) );
63 } // end method printEquality
```

5

## Arrays – Example (continued)

```
26     public void printArrays()
27     {
28         System.out.print( "doubleArray: " );
29         for ( double doubleValue : doubleArray )
30             System.out.printf( ".%1f ", doubleValue );
31
32         System.out.print( "\nintArray: " );
33         for ( int intValue : intArray )
34             System.out.printf( "%d ", intValue );
35
36         System.out.print( "\nfilledIntArray: " );
37         for ( int intValue : filledIntArray )
38             System.out.printf( "%d ", intValue );
39
40         System.out.print( "\nintArrayCopy: " );
41         for ( int intValue : intArrayCopy )
42             System.out.printf( "%d ", intValue );
43
44         System.out.println( "\n" );
45     } // end method printArrays
```

6

## Arrays – Example (continued)

```
65 public static void main( String args[] )
66 {
67     UsingArrays usingArrays = new UsingArrays();
68
69     usingArrays.printArrays();
70     usingArrays.printEquality();
71
72     int location = usingArrays.searchForInt( 5 );
73     if ( location >= 0 )
74         System.out.printf(
75             "Found 5 at element %d in intArray\n", location );
76     else
77         System.out.println( "5 not found in intArray" );
78
79     location = usingArrays.searchForInt( 8763 );
80     if ( location >= 0 )
81         System.out.printf(
82             "Found 8763 at element %d in intArray\n", location );
83     else
84         System.out.println( "8763 not found in intArray" );
85 } // end main
86 } // end class UsingArrays
```

7

## Java Collections Framework

- Group of objects can be kept in an array, but arrays are not feasible when number of objects increase or decrease during the execution of the program
- The **Java Collections Framework** is a collection of interfaces and classes that may be used to manipulate groups of objects
- The classes implemented in the **Java Collections Framework** serve as reusable data structures and include algorithms for common tasks such as sorting or searching
- The framework uses parameterized classes so you can use them with the classes of your choice
- The framework is largely contained in the package **java.util**

8

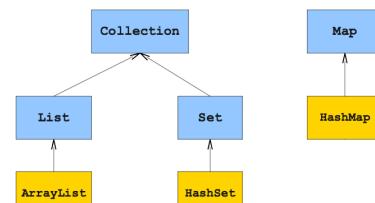

## Basic collections

### The three major collections in Java:

- **Set**: A collection of elements that is guaranteed to contain no duplicates.
- **List**: An ordered collection of elements, often accessed by integer indexes or by iteration.
- **Map**: A collection of key/value pairs in which each key is associated with a corresponding value.

9

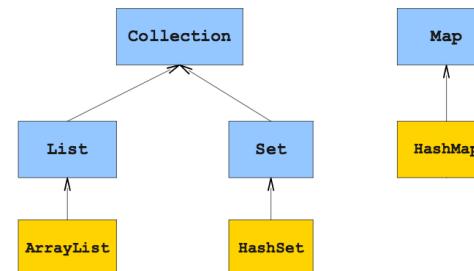

## What is a Set?

11

## java.util.Collection interface

- It is the highest level of Java's framework for collection classes
- It describes the basic operations that all collection classes (except **Map**) should implement (listed in the next page)
- The JDK does not provide any *direct* implementations of this interface: it provides implementations of more specific sub-interfaces like **Set** and **List** as in the example diagram below:

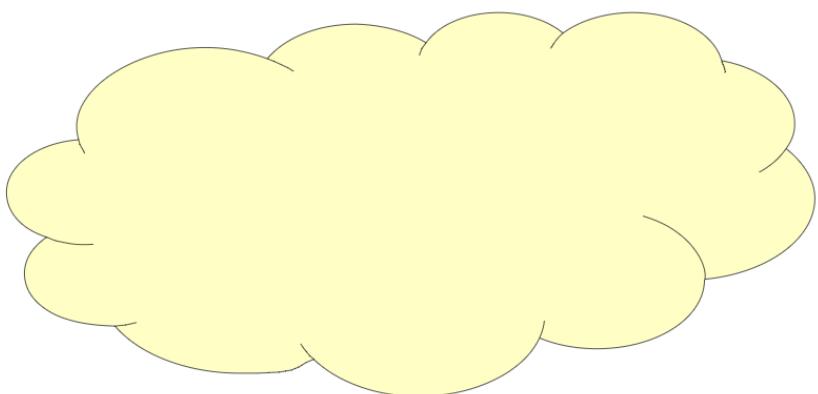

10

## java.util.Set interface

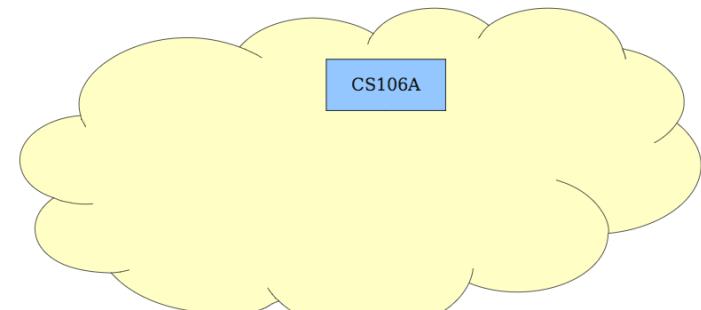

- A **Set** is a **Collection** that contains unique elements (i.e., no duplicate elements).
- The collections framework contains several **Set** implementations, including **HashSet**
- Major operations are:
  - Adding an element
  - Removing an element
  - Checking whether an element exists
- Useful for answering questions of the form "have I seen this before?"

12

```
HashSet<String> mySet = new HashSet<String>();
```

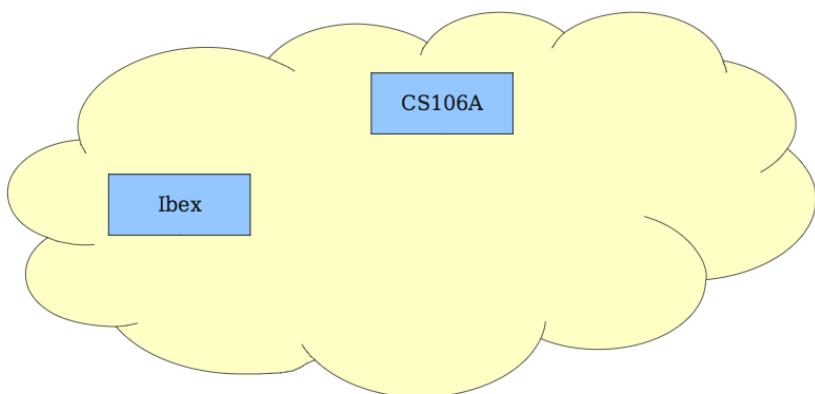

13

```
HashSet<String> mySet = new HashSet<String>();  
mySet.add("CS106A");
```

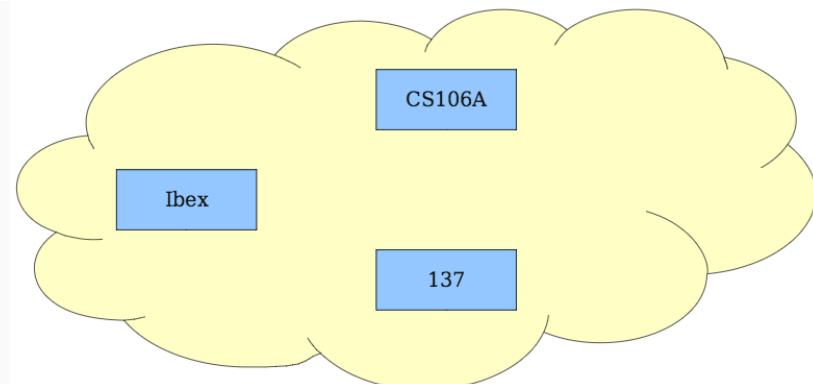

To add a value to a  
**HashSet**, use the syntax  
**set.add(value)**

14

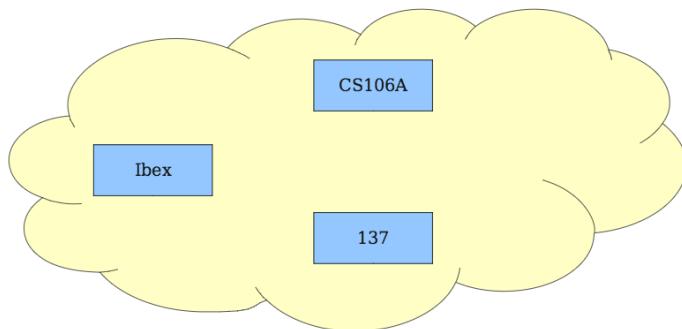

```
HashSet<String> mySet = new HashSet<String>();  
mySet.add("CS106A");  
mySet.add("Ibex");
```

15

```
HashSet<String> mySet = new HashSet<String>();  
mySet.add("CS106A");  
mySet.add("Ibex");  
mySet.add("137");
```

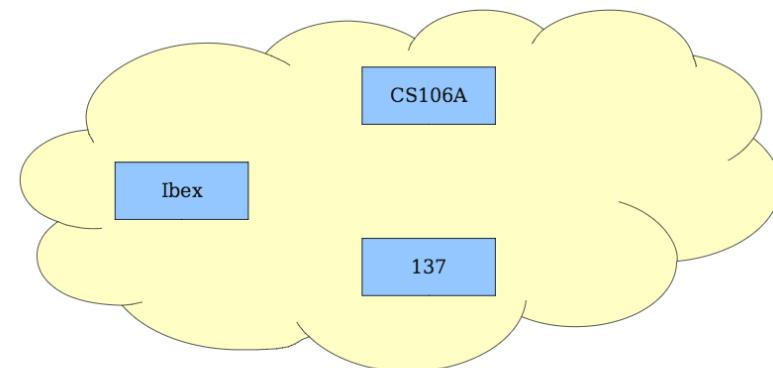

16

```
HashSet<String> mySet = new HashSet<String>();
mySet.add("CS106A");
mySet.add("Ibex");
mySet.add("137");
mySet.add("CS106A");
```

If you **add** a value pair where the value exists, nothing happens.

17

```
HashSet<String> mySet = new HashSet<String>();
mySet.add("CS106A");
mySet.add("Ibex");
mySet.add("137");
mySet.add("CS106A");

mySet.contains("Ibex");
```

18

## Basic Set Operations

- To insert an item:
  - **set.add(value)**
- To check whether a value exists
  - **set.contains(value)**
- To remove an item
  - **set.remove(value)**

19

## HashSet - Example

```
3 import java.util.List;
4 import java.util.Arrays;
5 import java.util.HashSet;
6 import java.util.Set;
7 import java.util.Collection;
8
9 public class SetTest
10 {
11     private static final String colors[] = { "red", "white", "blue",
12         "green", "gray", "orange", "tan", "white", "cyan",
13         "peach", "gray", "orange" };
14
15     // create and output ArrayList
16     public SetTest()
17     {
18         List< String > list = Arrays.asList( colors );
19         System.out.printf( "ArrayList: %s\n", list );
20         printNonDuplicates( list );
21     } // end SetTest constructor
```

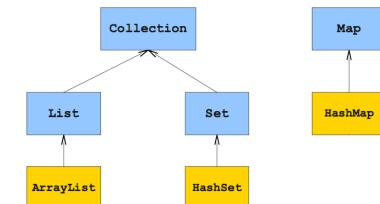

20

## HashSet – Example (continued)

```
23 // create set from array to eliminate duplicates
24 private void printNonDuplicates( Collection< String > collection )
25 {
26     // create a HashSet
27     Set< String > set = new HashSet< String >( collection );
28
29     System.out.println( "\nNonDuplicates are: " );
30
31     for ( String s : set )
32         System.out.printf( "%s ", s );
33
34     System.out.println();
35 } // end method printNonDuplicates
36
37 public static void main( String args[] )
38 {
39     new SetTest();
40 } // end main
41 } // end class SetTest
```

21

## What is a List?

22

## java.util.List interface

- A List (sometimes called a **sequence**) is an ordered Collection
- It can contain duplicate elements
- Like array indices, List indices are zero based (i.e., the first element's index is zero)
- In addition to the methods inherited from Collection, List provides methods for:
  - manipulating elements via their indices
  - manipulating a specified range of elements
  - searching for elements
  - getting a **ListIterator** to access the elements.

23

## Iterators

- To visit every element of a collection, you can use the “for each” loop:

```
for (ElemType elem: collection) {
    ...
}
```
- Alternatively, you can use an **iterator**, an object whose job is to walk over the elements of a collection.
- The iterator has two commands:
  - **hasNext()** returns true if there are more items to visit.
  - **next()** returns the next item and moves the iterator to the next position.

24

## ArrayList and Iterator - Example

```
3 import java.util.List;
4 import java.util.ArrayList;
5 import java.util.Collection;
6 import java.util.Iterator;
7
8 public class CollectionTest
9 {
10     private static final String[] colors =
11         { "MAGENTA", "RED", "WHITE", "BLUE", "CYAN" };
12     private static final String[] removeColors =
13         { "RED", "WHITE", "BLUE" };
14
15     // create ArrayList, add Colors to it and manipulate it
16     public CollectionTest()
17     {
18         List< String > list = new ArrayList< String >();
19         List< String > removeList = new ArrayList< String >();
20
21         // add elements in colors array to list
22         for ( String color : colors )
23             list.add( color );
24     }
```

25

## ArrayList and Iterator – Example (continued)

```
25     // add elements in removeColors to removeList
26     for ( String color : removeColors )
27         removeList.add( color );
28
29     System.out.println( "ArrayList: " );
30
31     // output list contents
32     for ( int count = 0; count < list.size(); count++ )
33         System.out.printf( "%s ", list.get( count ) );
34
35     // remove colors contained in removeList
36     removeColors( list, removeList );
37
38     System.out.println( "\n\nArrayList after calling removeColors: " );
39
40     // output list contents
41     for ( String color : list )
42         System.out.printf( "%s ", color );
43 } // end CollectionTest constructor
```

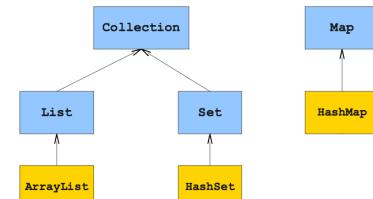

26

## ArrayList and Iterator - Example (continued)

```
45     // remove colors specified in collection2 from collection1
46     private void removeColors(
47         Collection< String > collection1, Collection< String > collection2 )
48     {
49         // get iterator
50         Iterator< String > iterator = collection1.iterator();
51
52         // loop while collection has items
53         while ( iterator.hasNext() )
54
55             if ( collection2.contains( iterator.next() ) )
56                 iterator.remove(); // remove current Color
57     } // end method removeColors
58
59     public static void main( String args[] )
60     {
61         new CollectionTest();
62     } // end main
63 } // end class CollectionTest
```

27

## What is a Map?

28

## java.util.Map interface

- **Maps** associate keys to values and cannot contain duplicate keys (i.e., each key can map to only one value)
- **Maps** differ from **Sets** in that **Maps** contain keys and values, whereas **Sets** contain only values

29

## HashMap - Example

```
3 import java.util.StringTokenizer;
4 import java.util.Map;
5 import java.util.HashMap;
6 import java.util.Set;
7 import java.util.TreeSet;
8 import java.util.Scanner;
9
10 public class WordTypeCount
11 {
12     private Map< String, Integer > map;
13     private Scanner scanner;
14
15     public WordTypeCount()
16     {
17         map = new HashMap< String, Integer >(); // create HashMap
18         scanner = new Scanner( System.in ); // create scanner
19         createMap(); // create map based on user input
20         displayMap(); // display map content
21     } // end WordTypeCount constructor
```

30

## HashMap – Example (continued)

```
23     // create map from user input
24     private void createMap()
25     {
26         System.out.println( "Enter a string:" ); // prompt for user input
27         String input = scanner.nextLine();
28
29         // create StringTokenizer for input
30         StringTokenizer tokenizer = new StringTokenizer( input );
31
32         // processing input text
33         while ( tokenizer.hasMoreTokens() ) // while more input
34         {
35             String word = tokenizer.nextToken().toLowerCase(); // get word
36
37             // if the map contains the word
38             if ( map.containsKey( word ) ) // is word in map
39             {
40                 int count = map.get( word ); // get current count
41                 map.put( word, count + 1 ); // increment count
42             } // end if
43             else
44                 map.put( word, 1 ); // add new word with a count of 1 to map
45         } // end while
46     } // end method createMap
```

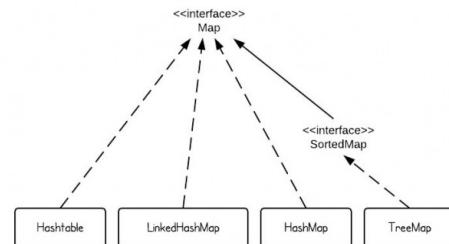

31

## HashMap – Example (continued)

```
48     // display map content
49     private void displayMap()
50     {
51         Set< String > keys = map.keySet(); // get keys
52
53         // sort keys
54         TreeSet< String > sortedKeys = new TreeSet< String >( keys );
55
56         System.out.println( "Map contains:\nKey\t\tValue" );
57
58         // generate output for each key in map
59         for ( String key : sortedKeys )
60             System.out.printf( "%-10s%-10s\n", key, map.get( key ) );
61
62         System.out.printf(
63             "\nsize:%d\nisEmpty:%b\n", map.size(), map.isEmpty() );
64     } // end method displayMap
65
66     public static void main( String args[] )
67     {
68         new WordTypeCount();
69     } // end main
70 } // end class WordTypeCount
```

32

## What is a Hashtable?

33

keys →      values ←

Student #	Grade

Homer	1786
Marge	8113
...	
Lisa	4321

35

## java.util.Properties class

- A **Properties** object is a *persistent Hashtable* that
  - stores key-value pairs of strings
  - assumes that you use methods **setProperty** and **getProperty** to manipulate the table rather than inherited **Hashtable** methods **put** and **get**.
  - A common use of Properties objects is to maintain application-configuration data or user preferences for applications

36

## Properties - Example

```
3 import java.io.FileOutputStream;
4 import java.io.FileInputStream;
5 import java.io.IOException;
6 import java.util.Properties;
7 import java.util.Set;
8
9 public class PropertiesTest
10 {
11     private Properties table;
12
13     // set up GUI to test Properties table
14     public PropertiesTest()
15     {
16         table = new Properties(); // create Properties table
17
18         // set properties
19         table.setProperty( "color", "blue" );
20         table.setProperty( "width", "200" );
```

37

## Properties – Example (continued)

```
22     System.out.println( "After setting properties" );
23     listProperties(); // display property values
24
25     // replace property value
26     table.setProperty( "color", "red" );
27
28     System.out.println( "After replacing properties" );
29     listProperties(); // display property values
30
31     saveProperties(); // save properties
32
33     table.clear(); // empty table
34
35     System.out.println( "After clearing properties" );
36     listProperties(); // display property values
37
38     loadProperties(); // load properties
```

38

## Properties – Example (continued)

```
40     // get value of property color
41     Object value = table.getProperty( "color" );
42
43     // check if value is in table
44     if ( value != null )
45         System.out.printf( "Property color's value is %s\n", value );
46     else
47         System.out.println( "Property color is not in table" );
48 } // end PropertiesTest constructor
```

39

## Properties – Example (continued)

```
50     // save properties to a file
51     public void saveProperties()
52     {
53         // save contents of table
54         try
55         {
56             FileOutputStream output = new FileOutputStream( "props.dat" );
57             table.store( output, "Sample Properties" ); // save properties
58             output.close();
59             System.out.println( "After saving properties" );
60             listProperties();
61         } // end try
62         catch ( IOException ioException )
63         {
64             ioException.printStackTrace();
65         } // end catch
66     } // end method saveProperties
```

40

## Properties – Example (continued)

```
69  public void loadProperties()
70  {
71      // load contents of table
72      try
73      {
74          FileInputStream input = new FileInputStream( "props.dat" );
75          table.load( input ); // load properties
76          input.close();
77          System.out.println( "After loading properties" );
78          listProperties(); // display property values
79      } // end try
80      catch ( IOException ioException )
81      {
82          ioException.printStackTrace();
83      } // end catch
84  } // end method loadProperties
```

41

## Properties – Example (continued)

```
86  // output property values
87  public void listProperties()
88  {
89      Set< Object > keys = table.keySet(); // get property names
90
91      // output name/value pairs
92      for ( Object key : keys )
93      {
94          System.out.printf(
95              "%s\t%s\n", key, table.getProperty( ( String ) key ) );
96      } // end for
97
98      System.out.println();
99  } // end method listProperties
100
101 public static void main( String args[] )
102 {
103     new PropertiesTest();
104 } // end main
105 } // end class PropertiesTest
```

42

## Summary

- Arrays are used for a group of objects, but maintenance is difficult when the size of the group changes during the execution of the program
- Java Collection Framework includes many interfaces and classes to easily manage groups of objects
- The interfaces and classes of the framework are mostly in **java.util** package
- Various interfaces include methods for special algorithms of various data structures
- Framework includes various implementations of these interfaces
- It is possible to implement or extend the interfaces/classes of the framework for new/different implementations of new/different data structures

43
