## **PROGRAMMING ASSIGNMENT 4**

Subject : Recursions Due Date : 10.12.2014

## 1 Introduction

**Alphametic:** An alphametic puzzle (also known as a *cryptarithm*) is a type of puzzle where words are put together into an arithmetic formula such that digits can be substituted for the letters to make the formula true. The main goal here is to assign each letter to a digit from 0 to 9. Each digit must be assigned only one letter, that's to say, not any digit can be assigned different letters.

If the puzzle above is considered, some letters were used multiple times and totally there are seven different letters must be found. To solve a puzzle there are two rules should be considered:

- 1. The leftmost letter can not be zero in any word.
- 2. There must be a one-to-one mapping between letters and digits. In other words, if you choose the digit 7 for the letter B, then all of the B's in the puzzle must be 7 and no other letter can be 7.

## 2 Experiment

**Puzzle Solver:** In this assignment you will create the algorithm that uses recursions to assign 0-9 digits to the letters. The algorithm consists of two processes: *puzzle creation* and *puzzle solving*.

In the *puzzle creation* process, user enters the words as illustrated in Fig. 1 and the algorithm should consider the following conditions:

- The length of all words must be greater than or equal to 2
- The length of all words must be less than or equal to 6.
- Total number of different letters in all words must be less than or equal to 10.

Once the conditions above are met, the algorithm can proceed to the next process ( $puzzle \ solving$ ).

In this process, the algorithm should try every possible digits for a letter by brute force approach to solve the puzzle. Thus it will have tried every occurrence for whole letters at the end of the search process. (Note: At first glance using iterative method may seems

Figure 1: Screenshot of initial window

reasonable; even so, you are obligated to use another way in the assignment, namely recursive method).

Depending on the puzzle structure user created, the algorithm starts to try every possible solutions for letters then displays them. Structurally, *puzzle solving* process consists of two parts, one of them produces the candidate solutions and the other checks if it works out correctly. To validate whether the algorithm works correctly or not, you are given below a benchmark test and its result found by the algorithm.

	D	O	N	A	L	D
+	G	E	R	A	L	D
	R	0	B	E	R	T

Once you have completed your algorithm, you should expect to see the results given below.

searching	(found!
DONALD:	526485
GERALD:	197485
ROBERT:	723970

As seen above, a puzzle as here has just one solution, in some other cases one puzzle may have multiple solutions. The algorithm has also to find the other solutions (if any).

**Hint:** You are given the pseudo code of the algorithm (Algorithm 1) that solves such type puzzles so that it helps you while implementing.

- 1. First, create a list of all the characters (letter) that need assigning to pass to solve.
- 2. If all characters are assigned, check them whether works out or not.
- 3. Otherwise take the first unassigned character from the list.
- 4. For (every possible choice among the digits not used before)
  - Assign that digit to the character taken then recursively try to assign the rest of characters (if any).
- $5. \mathbf{End} \mathbf{for}$
- 6. Until every possible solution is tried go to step 2.

Algorithm 1. Pseudo code of the *alphametics* 

## Notes

- Do not miss the deadline.
- Save all your work until the assignment is graded.
- The assignment must be original, individual work. Duplicate or very similar assignments are both going to be considered as cheating.
- You can ask your questions via Piazza (https://piazza.com/hacettepe.edu. tr/fall2014/bbm101) and you are supposed to be aware of everything discussed in Piazza.
- You will submit your work from https://submit.cs.hacettepe.edu.tr/index.php with the file hierarchy as below:

This file hierarchy must be zipped before submitted (Not .rar , only .zip files are supported by the system)

$$\begin{array}{l} \rightarrow < \text{student id} > \\ \rightarrow \text{hw4.c} \end{array}$$

Late Policy: You may use up to three extension days for the assignment. But each extension day will bring about additional 10% degradation for evaluation of the assignment.
