

Dictionaries

BBM 101 - Introduction to Programming I

Hacettepe University
Fall 2015

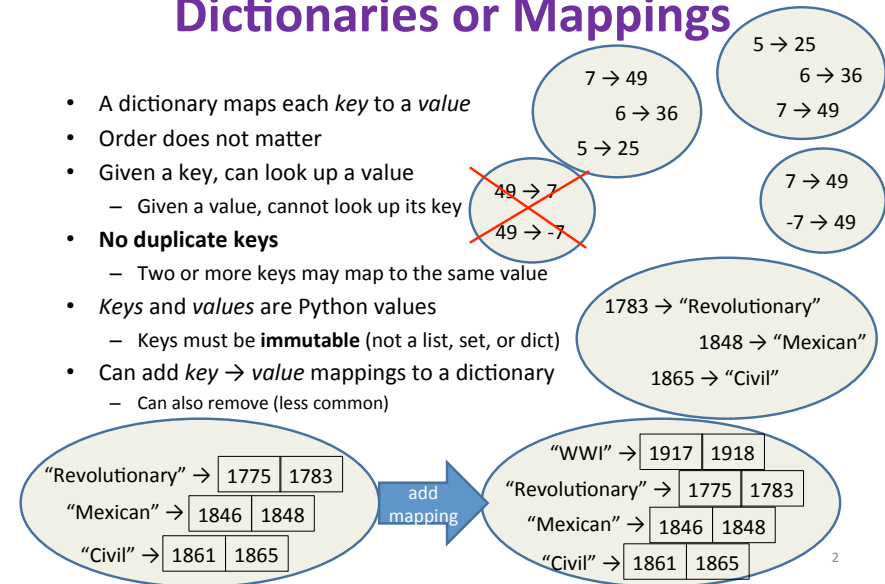

Fuat Akal, Aykut Erdem, Erkut Erdem, Vahid Garousi

Slides based on material prepared by Ruth Anderson, Michael Ernst and Bill Howe in the course CSE 140
University of Washington

1

Dictionaries or Mappings

- A dictionary maps each *key* to a *value*
- Order does not matter
- Given a key, can look up a value
 - Given a value, cannot look up its key
- **No duplicate keys**
 - Two or more keys may map to the same value
- *Keys and values* are Python values
 - Keys must be **immutable** (not a list, set, or dict)
- Can add *key* → *value* mappings to a dictionary
 - Can also remove (less common)

2

Dictionary Syntax in Python

```
d = { }  
d = dict()
```

Two different
ways to create an
empty dictionary

```
us_wars_by_end = {  
    1783: "Revolutionary",  
    1848: "Mexican",  
    1865: "Civil" }  
us_wars_by_name = {  
    "Civil": [1861, 1865],  
    "Mexican": [1846, 1848],  
    "Revolutionary": [1775, 1783]  
}
```

1783 → "Revolutionary"
1848 → "Mexican"
1865 → "Civil"

"Revolutionary" → [1775, 1783]
"Mexican" → [1846, 1848]
"Civil" → [1861, 1865]

Syntax just like arrays, for accessing and setting:

```
us_wars_by_end[1783]    ⇒  
us_wars_by_end[1783][1:10] ⇒  
us_wars_by_name["WWI"] = [1917, 1918]
```

3

Creating a Dictionary

```
>>> state = {"Atlanta" : "GA", "Seattle" : "WA"}
```

```
>>> phonebook = dict()  
>>> phonebook["Alice"] = "206-555-4455"  
>>> phonebook["Bob"] = "212-555-2211"
```

```
>>> atomicnumber = {}  
>>> atomicnumber["H"] = 1  
>>> atomicnumber["Fe"] = 26  
>>> atomicnumber["Au"] = 79
```

"Atlanta" → "GA"
"Seattle" → "WA"

"Alice" → "206-555-4455"
"Bob" → "212-555-1212"

"H" → 1
"Fe" → 26
"Au" → 79

4

Accessing a Dictionary

```
>>> atomicnumber = {"H":1, "Fe":26, "Au":79}
>>> atomicnumber["Au"]
79
>>> atomicnumber["B"]
Traceback (most recent call last):
  File "<pyshell#102>", line 1, in <module>
    atomicnumber["B"]
```

```
KeyError: 'B'
>>> atomicnumber.has_key("B")
False
```

```
>>> atomicnumber.keys()
['H', 'Au', 'Fe']
>>> atomicnumber.values()
[1, 79, 26]
>>> atomicnumber.items()
[('H', 1), ('Au', 79), ('Fe', 26)]
```

Good for iteration (for loops)

```
for key in mymap.keys():
    val = mymap[key]
    ... use key and val
```

```
for key in mymap:
    val = mymap[key]
    ... use key and val
```

```
for (key,val) in mymap.items():
    ... use key and val
```

5

"H" → 1
"Fe" → 26
"Au" → 79

Iterating Through a Dictionary

```
atomicnumber = {"H":1, "Fe":26, "Au":79}
```

```
# Print out all the keys:
for element_name in atomicnumber.keys():
    print element_name
# Another way to print out all the keys:
for element_name in atomicnumber:
    print element_name
```

```
# Print out the keys and the values
for (element_name, element_number) in atomicnumber.items():
    print "name:",element_name, "number:",element_number
```

6

Modifying a Dictionary

```
us_wars1 = {
    "Revolutionary" : [1775, 1783],
    "Mexican" : [1846, 1848],
    "Civil" : [1861, 1865] }
```

```
us_wars1["WWI"] = [1917, 1918] # add mapping
del us_wars_by_name["Mexican"] # remove mapping
```

7

Dictionary Exercises

- Convert a list to a dictionary:
 - Given [5, 6, 7], produce {5:25, 6:36, 7:49}
- Reverse key with value in a dictionary:
 - Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}
- What does this do?

```
squares = { 1:1, 2:4, 3:9, 4:16 }
squares[3] + squares[3]
squares[3 + 3]
squares[2] + squares[2]
squares[2 + 2]
```

8

Dictionary Exercise Solutions

- Convert a list to a dictionary:

- E.g. Given [5, 6, 7], produce {5:25, 6:36, 7:49}

```
d = {}  
for i in [5, 6, 7]: # or range(5, 8)  
    d[i] = i * i
```

- Reverse key with value in a dictionary:

- E.g. Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}

```
k = {}  
for i in d.keys():  
    k[d[i]] = i
```

9

A list is like a dictionary

- A list maps an integer to a value
 - The integers must be a continuous range 0..*i*

```
mylist = ['a', 'b', 'c']  
mylist[1] ⇒ 'b'  
mylist[3] = 'c' # error!
```

- In what ways is a list **more** convenient than a dictionary?
- In what ways is a list **less** convenient than a dictionary?

10

Not Every Value is Allowed to be a Key

- Keys must be immutable values
 - int, float, bool, string, *tuple*
 - *not*: list, set, dictionary
- Goal: only dictionary operations change the keyset
 - after “`mydict[x] = y`”, `mydict[x] ⇒ y`
 - if `a == b`, then `mydict[a] == mydict[b]`These conditions should hold until `mydict` itself is changed
- Mutable keys can violate these goals

```
list1 = ["a", "b"]  
list2 = list1  
list3 = ["a", "b"]  
mydict = {}  
mydict[list1] = "z"  
mydict[list3] ⇒ "z"  
list2.append("c")  
mydict[list1] ⇒ ???  
mydict[list3] ⇒ ???
```

⇐ Hypothetical; actually illegal in Python

11
