- > Strong components

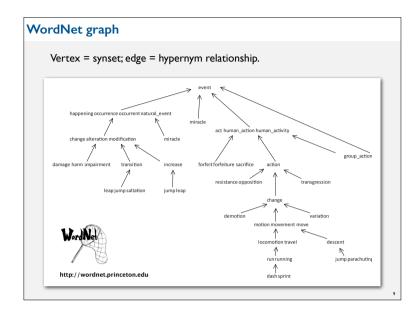

Some digraph problems

Path. Is there a directed path from s to t?

Shortest path. What is the shortest directed path from s to t?

Topological sort. Can you draw the digraph so that all edges point upwards?

Strong connectivity. Is there a directed path between all pairs of vertices?

Transitive closure. For which vertices v and w is there a path from v to w?

PageRank. What is the importance of a web page?

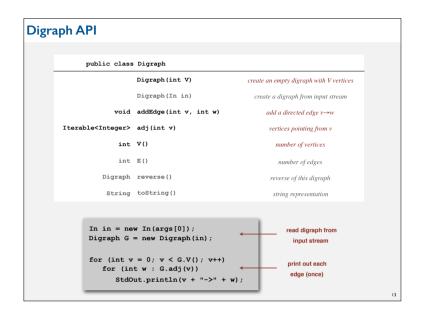

Digraph applications

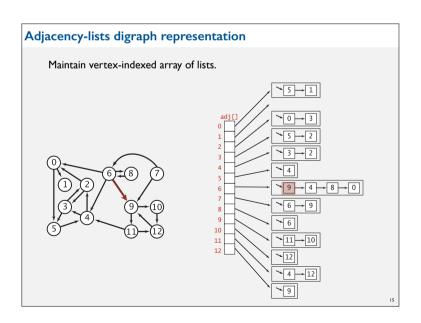

digraph	vertex	directed edge	
transportation	street intersection	one-way street	
web	web page	hyperlink	
food web	species	predator-prey relationship	
WordNet	synset	hypernym	
scheduling	task	precedence constraint	
financial	bank	transaction	
cell phone	person	placed call	
infectious disease	person	infection	
game	board position	legal move

Reachability application: mark-sweep garbage collector

Every data structure is a digraph.

- Vertex = object.
- Edge = reference.

Roots. Objects known to be directly accessible by program (e.g., stack).

Reachable objects. Objects indirectly accessible by program (starting at a root and following a chain of pointers).

ers).

Depth-first search in digraphs summary

DFS enables direct solution of simple digraph problems.

- √ Reachability.
 - Path finding.
 - Topological sort.
 - Directed cycle detection.

Basis for solving difficult digraph problems.

- 2-satisfiability.
- Directed Euler path.
- Strongly-connected components.

DEPTH-FIRST SEARCH AND LINEAR GRAPH ALGORITHMS*

ROBERT TAULAN!

Abstract. The value of depth-first stareds or "backtracking" as a technique for solving problems

illustrated by two examples. An improved version of an algorithm for finding the trendge) connected

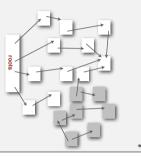

direct graph as presented. The topic and time requirements of the algorithms are bounded algorithms are bounded algorithms. The should algorithms are bounded algorithms. The should algorithms are bounded algorithms.

Reachability application: mark-sweep garbage collector

Mark-sweep algorithm. [McCarthy, 1960]

- Mark: mark all reachable objects.
- Sweep: if object is unmarked, it is garbage (so add to free list).

Memory cost. Uses I extra mark bit per object (plus DFS stack).

Breadth-first search in digraphs

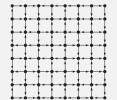

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- BFS is a digraph algorithm.

BFS (from source vertex s)

Put s onto a FIFO queue, and mark s as visited. Repeat until the queue is empty:

- remove the least recently added vertex v
- for each unmarked vertex pointing from v: add to queue and mark as visited.

Proposition. BFS computes shortest paths (fewest number of edges) from s to all other vertices n a digraph in time proportional to E+V.

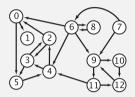

48

Multiple-source shortest paths

Multiple-source shortest paths. Given a digraph and a set of source vertices, find shortest path from any vertex in the set to each other vertex.

Ex. $S=\{1, 7, 10\}.$

- Shortest path to 4 is $7 \rightarrow 6 \rightarrow 4$.
- Shortest path to 5 is $7 \rightarrow 6 \rightarrow 0 \rightarrow 5$.
- Shortest path to 12 is $10\rightarrow 12$.

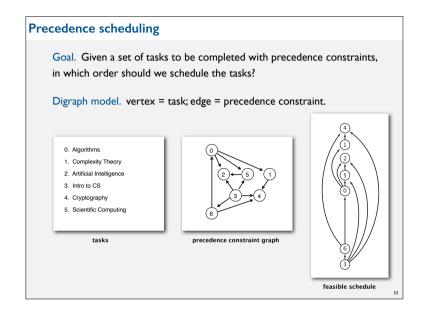

- Q. How to implement multi-source constructor?
- A. Use BFS, but initialize by enqueuing all source vertices.

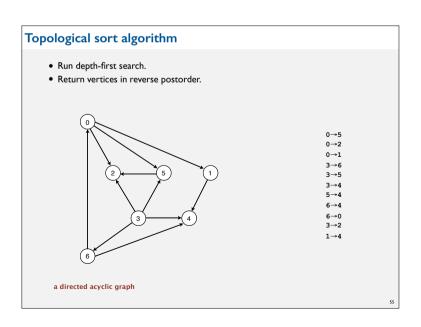

Bare-bones web crawler: Java implementation Queue<String> queue = new Queue<String>(); - queue of websites to crawl SET<String> discovered = new SET<String>(); set of discovered websites String root = "http://www.princeton.edu"; queue.enqueue(root); start crawling from root website discovered.add(root) while (!queue.isEmpty()) String v = queue.dequeue(); read in raw html from next StdOut.println(v); website in queue In in = new In(v); String input = in.readAll(); String regexp = "http://(\\w+\\.)*(\\w+)"; use regular expression to find all URLs Pattern pattern = Pattern.compile(regexp); in website of form http://xxx.yyy.zzz Matcher matcher = pattern.matcher(input); while (matcher.find()) [crude pattern misses relative URLs] String w = matcher.group(); if (!discovered.contains(w)) if undiscovered, mark it as discovered discovered.add(w); queue.enqueue(w); and put on queue

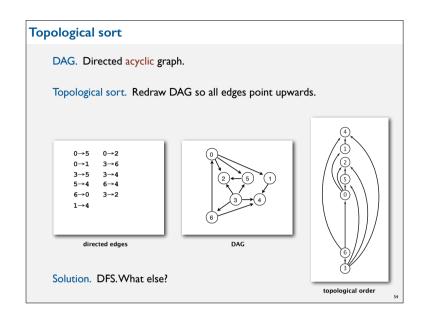

Goal. Crawl web, starting from some root web page, say www.princeton.edu. Solution. BFS with implicit graph. BFS. Choose root web page as source s. Maintain a Queue of websites to explore. Maintain a ser of discovered websites. Dequeue the next website and enqueue websites to which it links (provided you haven't done so before).

Depth-first search order public class DepthFirstOrder private boolean[] marked; private Stack<Integer> reversePost; public DepthFirstOrder(Digraph G) reversePost = new Stack<Integer>(); marked = new boolean[G.V()]; for (int v = 0; v < G.V(); v++) if (!marked[v]) dfs(G, v); private void dfs(Digraph G, int v) marked[v] = true; for (int w : G.adj(v)) if (!marked[w]) dfs(G, w); reversePost.push(v); returns all vertices in public Iterable<Integer> reversePost() { return reversePost; } "reverse DFS postorder

Directed cycle detection application: precedence scheduling

Scheduling. Given a set of tasks to be completed with precedence constraints, in what order should we schedule the tasks?

- → Strong components

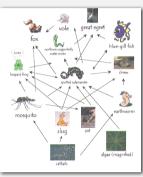

Strongly-connected components Def. Vertices v and w are strongly connected if there is a directed path from v to w and a directed path from w to v. Key property. Strong connectivity is an equivalence relation: v is strongly connected to v. If v is strongly connected to w, then w is strongly connected to v. If v is strongly connected to w and w to x, then v is strongly connected to x. Def. A strong component is a maximal subset of strongly-connected vertices.

Strong component application: ecological food webs

Food web graph. Vertex = species; edge = from producer to consumer.

http://www.twingroves.district96.k12.il.us/Wetlands/Salamander/SalGraphics/salfoodweb.gif

Strong component. Subset of species with common energy flow.

Strong components algorithms: brief history

1960s: Core OR problem.

- Widely studied; some practical algorithms.
- Complexity not understood.

1972: linear-time DFS algorithm (Tarjan).

- Classic algorithm.
- Level of difficulty: Algs4++.
- Demonstrated broad applicability and importance of DFS.

1980s: easy two-pass linear-time algorithm (Kosaraju-Sharir).

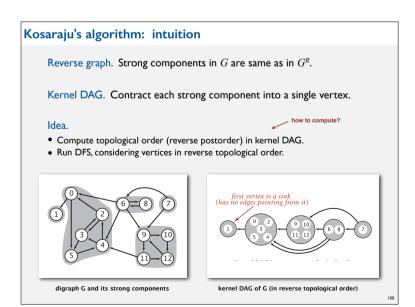

- Forgot notes for lecture; developed algorithm in order to teach it!
- Later found in Russian scientific literature (1972).

1990s: more easy linear-time algorithms.

- Gabow: fixed old OR algorithm.
- Cheriyan-Mehlhorn: needed one-pass algorithm for LEDA.

Software module dependency graph. • Vertex = software module. • Edge: from module to dependency. Firefox Strong component. Subset of mutually interacting modules. Approach I. Package strong components together.

Approach 2. Use to improve design!

Kosaraju's algorithm

- → DFS in reverse graph
- → DFS in original graph
