Chapter 2-Part III (Sec 2.4)

## Basic Structures:

- Sets
- Functions
- Sequences and Sums
- Cardinality of Sets

## Sequences and Sums

Section 2.4

## Section Summary

- Sequences.
- Examples: Geometric Progression, Arithmetic Progression
- Recurrence Relations
- Example: Fibonacci Sequence
- Summations

## Introduction

- Sequences are ordered lists of elements.
- $1,2,3,5,8$
- $1,3,9,27,81, \ldots \ldots$.
- Sequences arise throughout mathematics, computer science, and in many other disciplines, ranging from botany to music.
- We will introduce the terminology to represent sequences and sums of the terms in the sequences.

## Sequences

Definition: A sequence is a function $f$ from a subset of the integers to a set $S$.

- Domain is usually either the set $\{0,1,2,3,4, \ldots .$.$\} or$ $\{1,2,3,4, \ldots$.
- $a_{n}$ is a term of the sequence, denotes the image of the integer $n$
- $f(n)=a_{\mathrm{n}}$

## Sequences

Example: Consider the sequence $\left\{a_{n}\right\}$ where

$$
\begin{gathered}
a_{n}=\frac{1}{n} \quad\left\{a_{n}\right\}=\left\{a_{1}, a_{2}, a_{3}, \ldots\right\} \\
1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4} \ldots
\end{gathered}
$$

## Geometric Progression

Definition: A geometric progression is a sequence of the form:

$$
a, a r, a r^{2}, \ldots, a r^{n}, \ldots
$$

where the initial term $a$ and the common ratio $r$ are real numbers.
Examples:

1. Let $a=1$ and $r=-1$. Then:

$$
\left\{b_{n}\right\}=\left\{b_{0}, b_{1}, b_{2}, b_{3}, b_{4}, \ldots\right\}=\{1,-1,1,-1,1, \ldots\}
$$

2. Let $a=2$ and $r=5$. Then:

$$
\left\{c_{n}\right\}=\left\{c_{0}, c_{1}, c_{2}, c_{3}, c_{4}, \ldots\right\}=\{2,10,50,250,1250, \ldots\}
$$

3. Let $a=6$ and $r=1 / 3$. Then:

$$
\left\{d_{n}\right\}=\left\{d_{0}, d_{1}, d_{2}, d_{3}, d_{4}, \ldots\right\}=\left\{6,2, \frac{2}{3}, \frac{2}{9}, \frac{2}{27}, \ldots\right\}
$$

## Arithmetic Progression

Definition: A arithmetic progression is a sequence of the form: $\quad a, a+d, a+2 d, \ldots, a+n d, \ldots$
where the initial term a and the common difference $d$ are real numbers.
Examples:

1. Let $a=-1$ and $d=4$ :

$$
\left\{s_{n}\right\}=\left\{s_{0}, s_{1}, s_{2}, s_{3}, s_{4}, \ldots\right\}=\{-1,3,7,11,15, \ldots\}
$$

2. Let $a=7$ and $d=-3$ :

$$
\left\{t_{n}\right\}=\left\{t_{0}, t_{1}, t_{2}, t_{3}, t_{4}, \ldots\right\}=\{7,4,1,-2,-5, \ldots\}
$$

3. Let $a=1$ and $\mathrm{d}=2$ :

$$
\left\{u_{n}\right\}=\left\{u_{0}, u_{1}, u_{2}, u_{3}, u_{4}, \ldots\right\}=\{1,3,5,7,9, \ldots\}
$$

## Strings

Definition: A string is a finite sequence of characters from a finite set (an alphabet).

- Sequences of characters or bits are important in computer science.
- The empty string is represented by $\lambda$.
- The string abcde has length 5.

## Recurrence Relations

Definition: A recurrence relation for the sequence $\left\{a_{n}\right\}$ is an equation that expresses $a_{n}$ in terms of one or more of the previous terms of the sequence, namely, $a_{0}, a_{1}, \ldots, a_{n-1}$, for all integers $n$ with $n \geq n_{0}$, where $n_{0}$ is a nonnegative integer.

- A sequence is called a solution of a recurrence relation if its terms satisfy the recurrence relation.
- The initial conditions for a sequence specify the terms that precede the first term where the recurrence relation takes effect.

## Questions

Example 1: Let $\left\{a_{n}\right\}$ be a sequence that satisfies the recurrence relation $a_{n}=a_{n-1}+3$ for $n=1,2,3,4, \ldots$ and suppose that $a_{0}=2$. What are $a_{1}, a_{2}$ and $a_{3}$ ?
-Note that $a_{0}=2$ is the initial condition.

Solution: From the recurrence relation :

$$
\begin{aligned}
& a_{1}=a_{0}+3=2+3=5 \\
& a_{2}=5+3=8 \\
& a_{3}=8+3=11
\end{aligned}
$$

## Questions

Example 2: Let $\left\{a_{n}\right\}$ be a sequence that satisfies the recurrence relation $a_{n}=a_{n-1}-a_{n-2}$ for $n=2,3,4, \ldots$ and suppose that $a_{0}=3$ and $a_{1}=5$. What are $a_{2}$ and $a_{3}$ ?

Solution: From the recurrence relation:

$$
\begin{aligned}
& a_{2}=a_{1}-a_{0}=5-3=2 \\
& a_{3}=a_{2}-a_{1}=2-5=-3
\end{aligned}
$$

## Fibonacci Sequence

Definition: Define the Fibonacci sequence, $f_{0}, f_{1}, f_{2}, \ldots$, by:

- Initial Conditions: $f_{0}=0, f_{1}=1$
- Recurrence Relation: $f_{n}=f_{n-1}+f_{n-2}$

Example: Find $f_{2}, f_{3}, f_{4}, f_{5}$ and $f_{6}$.
Answer:

$$
\begin{aligned}
& f_{2}=f_{1}+f_{0}=1+0=1, \\
& f_{3}=f_{2}+f_{1}=1+1=2, \\
& f_{4}=f_{3}+f_{2}=2+1=3, \\
& f_{5}=f_{4}+f_{3}=3+2=5, \\
& f_{6}=f_{5}+f_{4}=5+3=8 .
\end{aligned}
$$

## Solving Recurrence Relations

- Finding a formula for the $n$th term of the sequence generated by a recurrence relation is called solving the recurrence relation.
- Such a formula is called a closed formula.
- Various methods for solving recurrence relations will be covered in Chapter 8 where recurrence relations will be studied in greater depth.
- Here we illustrate by example the method of iteration in which we need to guess the formula. The guess can be proved correct by the method of induction (Chapter 5).

## Iterative Solution Example

Method 1: Working upward, forward substitution
Let $\left\{a_{n}\right\}$ be a sequence that satisfies the recurrence relation $a_{n}=$ $a_{n-1}+3$ for $\mathrm{n}=2,3,4, \ldots$ and suppose that $a_{1}=2$.

$$
\begin{aligned}
& a_{2}=2+3 \\
& a_{3}=(2+3)+3=2+3 \cdot 2 \\
& a_{4}=(2+2 \cdot 3)+3=2+3 \cdot 3
\end{aligned}
$$

$$
a_{\mathrm{n}}=a_{n-1}+3=(2+3 \cdot(n-2))+3=2+3(n-1)
$$

## Iterative Solution Example

Method 2: Working downward, backward substitution
Let $\left\{a_{n}\right\}$ be a sequence that satisfies the recurrence relation
$a_{n}=a_{n-1}+3$ for $n=2,3,4, \ldots$ and suppose that $a_{1}=2$.

$$
\begin{aligned}
a_{\mathrm{n}}= & a_{\mathrm{n}-1}+3 \\
= & \left(a_{\mathrm{n}-2}+3\right)+3=a_{\mathrm{n}-2}+3 \cdot 2 \\
= & \left(a_{\mathrm{n}-3}+3\right)+3 \cdot 2=a_{\mathrm{n}-3}+3 \cdot 3 \\
& \cdot \\
& \cdot \\
& \cdot \\
= & a_{2}+3(\mathrm{n}-2) \\
= & \left(a_{1}+3\right)+3(\mathrm{n}-2) \\
= & 2+3(\mathrm{n}-1)
\end{aligned}
$$
