# Natural Language Processing

# What is Natural Language Processing?

- Natural Language Processing (NLP): The process of computer analysis of input provided in a human language (natural language), and conversion of this input into a useful form of representation.
- The field of NLP is primarily concerned with getting computers to perform useful and **interesting tasks** with human languages.
- The field of NLP is secondarily concerned with helping us come to a better understanding of human language.
- The **goal of NLP field** is to get computers to perform useful tasks involving human language, tasks like enabling human-machine communication, improving human-human communication, or simply doing useful processing of text or speech.

#### Forms of Natural Language

- The input/output of a NLP system can be:
  - written text
  - speech
- We will mostly concerned with **written text** in this course (not speech).
- To process written text, we need:
  - lexical, syntactic, semantic knowledge about the language
  - discourse information, real world knowledge
- To process spoken language, we need everything required to process written text, plus the challenges of speech recognition and speech synthesis.

#### **NLP Tasks**

- An application that requires the use of knowledge about human languages can be seen as a **NLP task**.
  - Word count is a NLP application since we need to know what a word is.
    - That's knowledge of language.
  - Line or byte count is not a NLP application.
- Some big NLP Tasks require a tremendous amount of knowledge of language.
  - Conversational agents
  - Machine translation
  - Question answering
  - Information extraction
- ... and many more NLP tasks

#### **NLP Tasks: Conversational agents**

- HAL computer in the movie `2001: A Space Odyssey` is an artificial agent capable of such advanced language-processing behavior as speaking and understanding English.
- We call programs like HAL that converse with humans via natural language conversational agents or dialogue systems.
- These kinds of applications require a tremendous amount of knowledge of language.
  - Speech recognition and synthesis
  - Knowledge of the English words involved
  - How groups of words clump and what the clumps mean?
  - Discourse

#### **NLP Tasks: Machine translation**

- The goal of **machine translation** is to automatically translate a document from one language to another.
- Translation from Stanford's Phrasal:

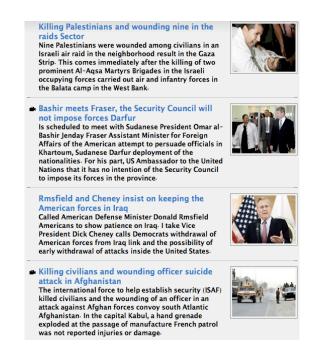

这不过是一个时间的问题.

This is only a matter of time.

Google Translate

#### **NLP Tasks: Machine Translation in ChatGPT**

Can you translate the following text into Turkish? The field of NLP is primarily concerned with getting computers to perform useful and interesting tasks with human languages.

Sure! Here's the translation:

"NLP (Doğal Dil İşleme) alanı, bilgisayarların insan dillerini kullanarak faydalı ve ilginç görevleri yerine getirmesini sağlamakla ilgilenir."

# **NLP Tasks: Question Answering**

- Question answering task is to find answers for the complete questions ranging from easy to hard questions.
  - What does "divergent" mean?
  - What year was Abraham Lincoln born?
  - How many states were in the United States that year?
  - How much Chinese silk was exported to England by the end of the 18th century?
  - What do scientists think about the ethics of human cloning?
- Some of these question, such as **definition** questions, or simple **factoid** questions like dates and locations can be easily answered.
- Answering more complicated questions might require **extracting information** that is embedded in the text, or doing **inference** (drawing conclusions based on known facts), or synthesizing and **summarizing information** from multiple sources.

# **NLP Tasks: Question Answering in ChatGPT**

What does "divergent" mean?

The word "divergent" generally refers to something that moves or extends in different directions from a common point. It can be used in various contexts:

- 1. In general use: Something that differs or separates from a common standard or point of view.
  - Example: "Their opinions were divergent on the issue."
- In mathematics: Refers to a series or sequence that does not have a limit, meaning it grows without bound.
  - Example: "The series is divergent because it doesn't approach a fixed value."
- 3. **In science/biology:** Refers to a process where different species or traits develop from a common ancestor, diverging over time.
  - Example: "The species became more divergent as they adapted to different environments."
- 4. **In literature/films:** Often used to describe characters, ideas, or narratives that break from the norm or follow a unique path, such as in the *Divergent* book/film series.

Would you like a deeper explanation of its use in a specific context?

Can you answer the following question shortly? What does "divergent" mean?

"Divergent" means something that moves or develops in different directions or becomes different from a common point or standard.

# **NLP Tasks: Question Answering in ChatGPT**

How much Chinese silk was exported to England by the end of the 18th century?

By the end of the 18th century, Chinese silk exports to England had grown significantly, primarily due to the increasing demand for luxury goods in Europe and the establishment of trade routes. The British East India Company played a major role in facilitating this trade, importing silk from China to England as part of the broader pattern of the global silk trade.

While precise figures are difficult to pinpoint for the entire century, it's estimated that by the late 1700s, silk was among the top commodities being imported into Britain from China. In the late 18th century, British imports of Chinese silk products (including raw silk and finished goods like textiles) reached substantial volumes. However, the precise quantity of silk can vary depending on the year and trade fluctuations. For example, in the 1780s, the value of British imports from China was recorded to be around £1 million annually, a significant portion of which consisted of silk goods.

Additionally, silk was highly prized and had a large presence in luxury markets in Britain, feeding into both fashion and the wider textile industry. The trade relationship continued to grow into the 19th century as well, with the British becoming major consumers of Chinese silk.

#### **NLP Tasks: Information Extraction**

• **Information extraction** is the extraction of events and its attributes from natural language texts.

Subject: curriculum meeting

Date: January 15, 2012

To: Dan Jurafsky

Hi Dan, we've now scheduled the curriculum meeting. It will be in Gates 159 tomorrow from 10:00-11:30.

Event: Curriculum mtg Date: Jan-16-2012 Start: 10:00am End: 11:30am Where: Gates 159

#### **NLP Tasks: Information Extraction in ChatGPT**

Can you extract the event and its attributes from the following text? We are going to meet tomorrow in the science building room:14 on 15:30 for the curriculum meeting.

Sure! Here's the event and its attributes extracted from the text:

Event: Curriculum meeting

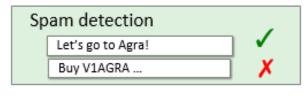

Date: Tomorrow

Time: 15:30

Location: Science building, Room 14

#### Language Technology

#### mostly solved

Part-of-speech (POS) tagging

ADJ ADJ NOUN VERB ADV

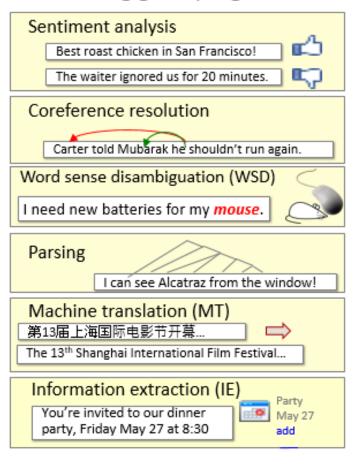

Colorless green ideas sleep furiously.

Named entity recognition (NER)

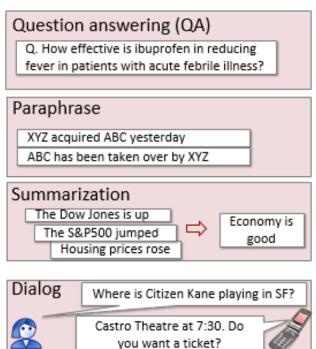

PERSON ORG LOC

Einstein met with UN officials in Princeton

#### making good progress

#### still really hard

# **Knowledge in Language Processing**

- What distinguishes *language processing applications* from other data processing systems is their use of **knowledge of language**.
  - Some simple NLP tasks require limited knowledge of language.
  - Big NLP tasks such as conversational agents, machine translation systems, robust questionanswering systems, require much broader and deeper knowledge of language.
- **Phonology** concerns how words are related to the sounds that realize them.
- **Morphology** concerns how words are constructed from more basic meaning units called morphemes. A *morpheme* is the primitive unit of meaning in a language.
- **Syntax** concerns how can be put together to form correct sentences and determines what structural role each word plays in the sentence and what phrases are subparts of other phrases.

#### **Knowledge in Language Processing**

- **Semantics** concerns what words mean and how these meaning combine in sentences to form sentence meaning. The study of context-independent meaning.
- **Discourse** concerns how the immediately preceding sentences affect the interpretation of the next sentence.
  - For example, interpreting pronouns and interpreting the temporal aspects of the information.
- World Knowledge includes general knowledge about the world.
  - What each language user must know about the other's beliefs and goals.

#### Why NLP is hard?

- Natural language is extremely rich in form and structure, and very ambiguous.
  - How to represent meaning,
  - Which structures map to which meaning structures.
- One input can mean many different things and **Ambiguity** can be at different levels.
  - Lexical (word level) ambiguity -- different meanings of words
  - Syntactic ambiguity -- different ways to parse the sentence
  - Interpreting partial information -- how to interpret pronouns
  - Contextual information -- context of the sentence may affect the meaning of that sentence.
- Many input can mean the same thing.
- Interaction among components of the input is not clear.

# **Ambiguity**

#### I made her duck.

- How many different interpretations does this sentence have?
- What are the reasons for the ambiguity?
- The categories of knowledge of language can be thought of as ambiguity resolving components.
- How can each ambiguous piece be resolved?
- Does speech input make the sentence even more ambiguous?
  - Yes deciding word boundaries

#### **Ambiguity (cont.)**

- Some interpretations of: I made her duck.
  - 1. I cooked *duck* for her.
  - 2. I cooked *duck* belonging to her.
  - 3. I created a toy duck which she owns.
  - 4. I caused her to quickly lower her head or body.
  - 5. I used magic and turned her into a *duck*.
- duck morphologically and syntactically ambiguous: noun or verb.
- her syntactically ambiguous: dative or possessive.
- make semantically ambiguous: cook or create.
- make syntactically ambiguous:
  - Transitive takes a direct object. => 2
  - Di-transitive takes two objects. => 5
  - Takes a direct object and a verb. => 4

#### **Ambiguity in a Turkish Sentence**

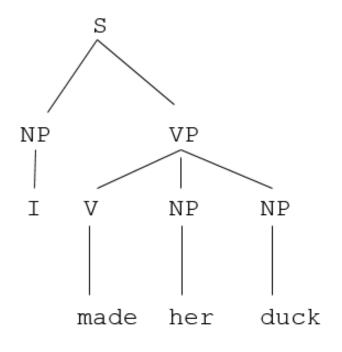

- Some interpretations of: Adamı gördüm.
  - 1. I saw the man.
  - 2. I saw my island.
  - 3. I visited my island.
  - 4. I bribed the man.
- Morphological Ambiguity:
  - ada-m-1 ada+P1SG+ACC
  - adam-1 adam+ACC
- Semantic Ambiguity:
  - gör to see
  - gör to visit
  - gör to bribe

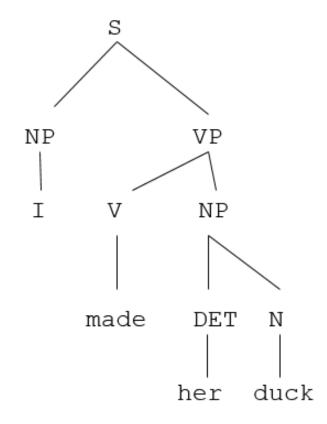

#### **Resolve Ambiguities**

- We will introduce *models* and *algorithms* to resolve ambiguities at different levels.
- part-of-speech tagging -- Deciding whether duck is verb or noun.
- word-sense disambiguation -- Deciding whether make is create or cook.
- **lexical disambiguation** -- Resolution of part-of-speech and word-sense ambiguities are two important kinds of lexical disambiguation.
- syntactic ambiguity -- her duck is an example of syntactic ambiguity, and can be addressed by probabilistic parsing.

# **Resolve Ambiguities (cont.)**

#### I made her duck

# Models to Represent Linguistic Knowledge

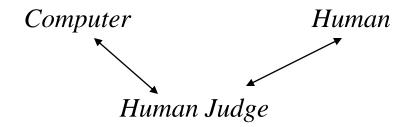

- We use certain formalisms (*models*) to represent the required linguistic knowledge.
- State Machines -- FSAs, FSTs, HMMs
- Formal Rule Systems -- Context Free Grammars, Probabilistic CFGs.
- Logic-Based Formalisms -- first order predicate logic, some higher order logic.
- **Models of Uncertainty** -- Bayesian probability theory.
- **Vector-space models** to represent meanings of words
  - word embeddings to represent meanings.

# Algorithms to Manipulate Linguistic Knowledge

- We use *algorithms* to manipulate the models of linguistic knowledge to produce the desired behavior.
- Most of the algorithms that we study are transducers and parsers.
  - These algorithms construct some structure based on their input.
- Since the language is ambiguous at all levels, these algorithms are never simple processes.
- Categories of most algorithms that will be used can fall into following categories.
  - state space search
  - dynamic programming

#### Language and Intelligence

#### **Turing Test**

- *Human Judge* asks tele-typed questions to *Computer* and *Human*.
- *Computer's* job is to act like a human.
- *Human's* job is to convince Judge that he is not machine.
- *Computer* is judged "intelligent" if it can fool the judge
- Judgment of intelligence is linked to appropriate answers to questions from the system.

# **Natural Language Understanding**

```
Morphological Analysis

    ★ Morphologically analyzed words (another step: POS tagging)

Syntactic Analysis
       Syntactic Structure
Semantic Analysis
         Context-independent meaning representation
Discourse Processing
         Final meaning representation
```

# **Morphological Analysis**

- Analyzing words into their linguistic components (morphemes).
- Morphemes are the smallest meaningful units of language.

cars car+PLU

giving give+PROG

geliyordum gel+PROG+PAST+1SG - I was coming

Ambiguity: More than one alternatives

flies  $fly_{VERB} + AOR$ 

fly<sub>NOUN</sub>+PLU

adamı adam+ACC - the man (accusative)

adam+P3SG - his/her man

ada+P1SG+ACC - my island (accusative)

#### Morphological Analysis (cont.)

• Relatively simple for English. But for some languages such as Turkish, it is more difficult.

uygarlaştıramadıklarımızdanmışsınızcasına uygar-laş-tır-ama-dık-lar-ımız-dan-mış-sınız-casına

```
Uygar +BEC +CAUS +NEGABLE +PPART +PL +P1PL +ABL +PAST +2PL +AsIf
```

"(behaving) as if you are among those whom we could not civilize/cause to become civilized"

+BEC is "become" in English

+CAUS is the causative voice marker on a verb

+PPART marks a past participle form

+P1PL is 1st person plural possessive marker

+2PL is 2nd person plural

+ABL is the ablative (from/among) case marker

+AsIf is a derivational marker that forms an adverb from a finite verb form

+Aslf is a derivational marker that forms an adverb from a finite verb form

+NEGABLE is "not able" in English

- Inflectional and Derivational Morphology.
- Common tools: Finite-state transducers

# Part-of-Speech (POS) Tagging

- Each word has a part-of-speech tag to describe its category.
- Part-of-speech tag of a word is one of major word groups (or its subgroups).
  - open classes -- noun, verb, adjective, adverb
  - closed classes -- prepositions, determiners, conjunctions, pronouns, participles
- POS Taggers try to find POS tags for the words.
- duck is a verb or noun? (morphological analyzer cannot make decision).
- A POS tagger may make that decision by looking the surrounding words.
  - Duck! (verb)
  - Duck is delicious for dinner. (noun)

# **Lexical Processing**

- The purpose of lexical processing is to determine meanings of individual words.
- Basic methods is to lookup in a database of meanings -- lexicon
- We should also identify non-words such as punctuation marks.
- Word-level ambiguity -- words may have several meanings, and the correct one cannot be chosen based solely on the word itself.
  - bank in English
  - yüz in Turkish
- Solution -- resolve the ambiguity on the spot by POS tagging (if possible) or pass-on the ambiguity to the other levels.

# **Syntactic Processing**

- **Parsing** -- converting a flat input sentence into a hierarchical structure that corresponds to the units of meaning in the sentence.
- There are different parsing formalisms and algorithms.
- Most formalisms have two main components:
  - grammar -- a declarative representation describing the syntactic structure of sentences in the language.
  - parser -- an algorithm that analyzes the input and outputs its structural representation (its parse) consistent with the grammar specification.
- CFGs are in the center of many of the parsing mechanisms. But they are complemented by some additional features that make the formalism more suitable to handle natural languages.

# **Semantic Analysis**

- Assigning meanings to the structures created by syntactic analysis.
- Mapping words and structures to particular domain objects in way consistent with our knowledge of the world.
- Semantic can play an import role in selecting among competing syntactic analyses and discarding illogical analyses.
  - I robbed the bank -- bank is a river bank or a financial institution
- We have to decide the formalisms which will be used in the meaning representation.

#### **Knowledge Representation for NLP**

- Which knowledge representation will be used depends on the application
  - Requires the choice of representational framework, as well as the specific meaning vocabulary (what are concepts and relationship between these concepts -- ontology)
  - Must be computationally effective.
- Common representational formalisms:
  - first order predicate logic
  - conceptual dependency graphs
  - semantic networks
  - Frame-based representations
  - Vector-space models

#### **Discourse**

- Discourses are collection of coherent sentences (not arbitrary set of sentences)
- Discourses have also hierarchical structures (similar to sentences)
- anaphora resolution -- to resolve referring expression
  - Mary bought a book for Kelly. She didn't like it.
    - **She** refers to Mary or Kelly. -- possibly Kelly
    - It refers to what -- book.
  - Mary had to lie for Kelly. She didn't like it.
- Discourse structure may depend on application.
  - Monologue
  - Dialogue
  - Human-Computer Interaction
