Goal. Sort any type of data.

Ex 1. Sort random real numbers in ascending order.

seems artificial, but stay tuned for an application

```java
public class Experiment
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        Double[] a = new Double[N];
        for (int i = 0; i < N; i++)
            a[i] = StdRandom.uniform();
        Insertion.sort(a);
        for (int i = 0; i < N; i++)
            StdOut.println(a[i]);
    }
}
```

% java Experiment 10
0.08614716385210452
0.09054270895414829
0.10708746304898642
0.21166190071646818
0.363292849257276
0.460954145685913
0.5340026311350087
0.7216129793703496
0.9003500354411443
0.9293994908845686
Goal. Sort any type of data.

Ex 2. Sort strings from file in alphabetical order.

```java
public class StringSorter {
    public static void main(String[] args) {
        String[] a = In.readStrings(args[0]);
        Insertion.sort(a);
        for (int i = 0; i < a.length; i++)
            StdOut.println(a[i]);
    }
}
```

% more words3.txt
bed bug dad yet zoo ... all bad yes

% java StringSorter words3.txt
all bad bed bug dad ... yes yet zoo
Sample sort client

**Goal.** Sort any type of data.

**Ex 3.** Sort the files in a given directory by filename.

```java
import java.io.File;
public class FileSorter {
    public static void main(String[] args) {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

% java FileSorter

InsertionX.class
InsertionX.java
Selection.class
Selection.java
Shell.class
Shell.java
ShellX.class
ShellX.java
callbacks

goal. sort any type of data.

q. how can sort() know how to compare data of type double, string, and java.io.file without any information about the type of an item's key?

callback = reference to executable code.
• client passes array of objects to sort() function.
• the sort() function calls back object's compareTo() method as needed.

implementing callbacks.
• java: interfaces.
• c: function pointers.
• c++: class-type functors.
• c#: delegates.
• python, perl, ml, javascript: first-class functions.
Callbacks: roadmap

client

```java
import java.io.File;
public class FileSorter {
    public static void main(String[] args) {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

object implementation

```java
public class File implements Comparable<File> {
    ...
    public int compareTo(File b) {
        ...
        return -1;
        ...
        return +1;
    ...
    return 0;
    }
}
```

Comparable interface (built in to Java)

```java
public interface Comparable<Item> {
    public int compareTo(Item that);
}
```

sort implementation

```java
public static void sort(Comparable[] a) {
    int N = a.length;
    for (int i = 0; i < N; i++)
        for (int j = i; j > 0; j--)
            if (a[j].compareTo(a[j-1]) < 0)
                exch(a, j, j-1);
        else break;
}
```

key point: no dependence on File data type
A **total order** is a binary relation $\leq$ that satisfies

- **Antisymmetry:** if $v \leq w$ and $w \leq v$, then $v = w$.
- **Transitivity:** if $v \leq w$ and $w \leq x$, then $v \leq x$.
- **Totality:** either $v \leq w$ or $w \leq v$ or both.

**Ex.**

- Standard order for natural and real numbers.
- Alphabetical order for strings.
- Chronological order for dates.
- ...
Implement `compareTo()` so that `v.compareTo(w)`

- Is a total order.
- Returns a negative integer, zero, or positive integer if `v` is less than, equal to, or greater than `w`, respectively.
- Throws an exception if incompatible types (or either is `null`).

**Comparable API**

![](image)

**Built-in comparable types.** Integer, Double, String, Date, File, ...

**User-defined comparable types.** Implement the `Comparable` interface.
Implementing the Comparable interface

**Date data type. Simplified version of java.util.Date.**

```java
public class Date implements Comparable<Date> {
    private final int month, day, year;

    public Date(int m, int d, int y) {
        month = m;
        day   = d;
        year  = y;
    }

    public int compareTo(Date that) {
        if (this.year < that.year ) return -1;
        if (this.year > that.year ) return +1;
        if (this.month < that.month) return -1;
        if (this.month > that.month) return +1;
        if (this.day   < that.day  ) return -1;
        if (this.day   > that.day  ) return +1;
        return 0;
    }
}
```

only compare dates to other dates
Two useful sorting abstractions

**Helper functions.** Refer to data through compares and exchanges.

**Less.** Is item \( v \) less than \( w \)?

```java
private static boolean less(Comparable v, Comparable w) {
    return v.compareTo(w) < 0;
}
```

**Exchange.** Swap item in array \( a[] \) at index \( i \) with the one at index \( j \).

```java
private static void exch(Comparable[] a, int i, int j) {
    Comparable swap = a[i];
    a[i] = a[j];
    a[j] = swap;
}
```

![Sorted cards](image)
Selection sort: Java implementation

```java
public class Selection {
    public static void sort(Comparable[] a) {
        int N = a.length;
        for (int i = 0; i < N; i++) {
            int min = i;
            for (int j = i+1; j < N; j++)
                if (less(a[j], a[min]))
                    min = j;
            exch(a, i, min);
        }
    }

    private static boolean less(Comparable v, Comparable w) {
        /* as before */
    }

    private static void exch(Comparable[] a, int i, int j) {
        /* as before */
    }
}
```
Proposition. Selection sort uses \((N - 1) + (N - 2) + \ldots + 1 + 0 \sim N^2 / 2\) compares and \(N\) exchanges.

</table>

Entries in black are examined to find the minimum. Entries in red are \(a[\text{min}]\). Entries in gray are in final position.

Running time insensitive to input. Quadratic time, even if input array is sorted. Data movement is minimal. Linear number of exchanges.

    private static void exch(Comparable[] a, int i, int j) {
        /* as before */
    }
}
Proposition. To sort a randomly-ordered array with distinct keys, insertion sort uses $\sim \frac{1}{4} N^2$ compares and $\sim \frac{1}{4} N^2$ exchanges on average.

Pf. Expect each entry to move halfway back.

Trace of insertion sort (array contents just after each insertion)

entries in gray do not move

entry in red is $a[j]$

entries in black moved one position right for insertion
Insertion sort: animation

40 random items

http://www.sorting-algorithms.com/insertion-sort
Best case. If the array is in ascending order, insertion sort makes $N - 1$ compares and 0 exchanges.

Worst case. If the array is in descending order (and no duplicates), insertion sort makes $\sim \frac{1}{2} N^2$ compares and $\sim \frac{1}{2} N^2$ exchanges.
Insertion sort: animation

40 reverse-sorted items

http://www.sorting-algorithms.com/insertion-sort
Def. An inversion is a pair of keys that are out of order.

\[
\begin{array}{cccccccccc}
A & E & E & L & M & O & T & R & X & P & S \\
\end{array}
\]

\[
\cdot T & - R & T & - P & T & - S & R & - P & X & - P & X & - S \\
\text{(6 inversions)}
\]

Def. An array is partially sorted if the number of inversions is \( \leq cN \).

- Ex 1. A subarray of size 10 appended to a sorted subarray of size \( N \).
- Ex 2. An array of size \( N \) with only 10 entries out of place.

Proposition. For partially-sorted arrays, insertion sort runs in linear time.

Pf. Number of exchanges equals the number of inversions.

\[
\text{number of compares} = \text{exchanges} + (N - 1)
\]

Elementary Sorting Algorithms

- Sorting review
- Rules of the game
- Selection sort
- Insertion sort
- Shellsort
Idea. Move entries more than one position at a time by \textit{h-sorting} the array.

Shellsort. [Shell 1959] \textit{h-sort} the array for decreasing seq. of values of \( h \).
How to $h$-sort an array? Insertion sort, with stride length $h$.

Why insertion sort?
- Big increments $\Rightarrow$ small subarray.
- Small increments $\Rightarrow$ nearly in order. [stay tuned]
Shell sort example: increments 7, 3, 1

**input**
```

still 7-sorted
Shellsort: which increment sequence to use?

Powers of two. 1, 2, 4, 8, 16, 32, ...
No.

Powers of two minus one. 1, 3, 7, 15, 31, 63, ...
Maybe.

3x + 1. 1, 4, 13, 40, 121, 364, ...
OK. Easy to compute.

Sedgewick. 1, 5, 19, 41, 109, 209, 505, 929, 2161, 3905, ...
Good. Tough to beat in empirical studies.

Why are we interested in shellsort?

Example of simple idea leading to substantial performance gains.

Useful in practice.
- Fast unless array size is huge.
- Tiny, fixed footprint for code (used in embedded systems).
- Hardware sort prototype.

Simple algorithm, nontrivial performance, interesting questions.
- Asymptotic growth rate?
- Best sequence of increments?
- Average-case performance?

Lesson. Some good algorithms are still waiting discovery.
