Shortest Paths

- Edge-weighted digraph API
- Shortest-paths properties
- Dijkstra’s algorithm
- Edge-weighted DAGs
- Negative weights

Shortest paths in a weighted digraph

Given an edge-weighted digraph, find the shortest (directed) path from \( s \) to \( t \).

Edge-weighted digraph

```
4->5 0.35
5->4 0.35
4->7 0.37
5->7 0.28
7->5 0.28
5->1 0.32
0->4 0.38
0->2 0.26
7->3 0.39
1->3 0.29
2->7 0.34
6->2 0.40
3->6 0.52
6->0 0.58
6->4 0.93
```

Shortest path from 0 to 6

- 0->2 0.26
- 2->7 0.34
- 7->3 0.39
- 3->6 0.52
Google maps

Car navigation

Shortest path applications

- PERT/CPM.
- Map routing.
- Seam carving.
- Robot navigation.
- Texture mapping.
- Typesetting in TeX.
- Urban traffic planning.
- Optimal pipelining of VLSI chip.
- Telemarketer operator scheduling.
- Routing of telecommunications messages.
- Network routing protocols (OSPF, BGP, RIP).
- Exploiting arbitrage opportunities in currency exchange.
- Optimal truck routing through given traffic congestion pattern.

Shortest path variants

Which vertices?
- Source-sink: from one vertex to another.
- Single source: from one vertex to every other.
- All pairs: between all pairs of vertices.

Restrictions on edge weights?
- Nonnegative weights.
- Arbitrary weights.
- Euclidean weights.

Cycles?
- No directed cycles.
- No "negative cycles."

Simplifying assumption. Shortest paths from \( s \) to each vertex \( v \) exist.
**Shortest Paths**

- Edge-weighted digraph API
- Shortest-paths properties
- Dijkstra’s algorithm
- Edge-weighted DAGs
- Negative weights

**Weighted directed edge API**

```
public class DirectedEdge
{
    private final int v, w;
    private final double weight;

    public DirectedEdge(int v, int w, double weight)
    {
        this.v = v;
        this.w = w;
        this.weight = weight;
    }

    public int from()
    {  return v;  }

    public int to()
    {  return w;  }

    public int weight()
    {  return weight; }

    String toString()
    {  return String.valueOf(weight); }
}
```

Idiom for processing an edge e: `int v = e.from(), w = e.to();`

**Edge-weighted digraph API**

```
public class EdgeWeightedDigraph
{
    EdgeWeightedDigraph(int V)
    {  edge-weighted digraph with V vertices  }

    EdgeWeightedDigraph(In in)
    {  edge-weighted digraph from input stream  }

    void addEdge(DirectedEdge e)
    {  add weighted directed edge e  }

    Iterable<DirectedEdge> adj(int v)
    {  edges pointing from v  }

    int V()
    {  number of vertices  }

    int E()
    {  number of edges  }

    Iterable<DirectedEdge> edges()
    {  all edges  }

    String toString()
    {  string representation  }
}
```

Conventions. Allow self-loops and parallel edges.
### Edge-weighted digraph: adjacency-lists representation

**Bag objects**

- Reference to a `DirectedEdge` object

- Adjacency-lists representation

```
0: 2.26 4.00 6.13
1: 2.19 2.26 3.52
2: 7.13 1.34 7.34
3: 6.13 0.72 2.40
4: 7.13 5.28 4.37
5: 0.35 0.28 7.28
6: 0.26 0.29 0.19
7: 0.39 0.19 0.29
```

### Edge-weighted digraph: adjacency-lists implementation in Java

Same as `EdgeWeightedGraph` except replace `Graph` with `Digraph`.

```java
class EdgeWeightedDigraph {
    private final int V;
    private final Bag<DirectedEdge>[] adj;

    public EdgeWeightedDigraph(int V) {
        this.V = V;
        adj = (Bag<DirectedEdge>[]) new Bag[V];
        for (int v = 0; v < V; v++)
            adj[v] = new Bag<DirectedEdge>();
    }

    public void addEdge(DirectedEdge e) {
        int v = e.from();
        adj[v].add(e);
    }

    public Iterable<DirectedEdge> adj(int v) {
        return adj[v];
    }
}
```

### Single-source shortest paths API

**Goal.** Find the shortest path from `s` to every other vertex.

```
public class SP {
    SP(EdgeWeightedDigraph G, int s)
        shortest paths from `s` in graph `G`
    double distTo(int v)
        length of shortest path from `s` to `v`
    Iterable<DirectedEdge> pathTo(int v)
        shortest path from `s` to `v`
    boolean hasPathTo(int v)
        is there a path from `s` to `v`?
}
```

```java
% java SP tinyEWD.txt 0
0 to 0 (0.00):
0 to 1 (1.05): 0->4 0.38  4->5 0.35  5->1 0.32
0 to 2 (0.26): 0->2 0.26
0 to 3 (0.39): 0->2 0.26  2->7 0.34  7->3 0.39
0 to 4 (0.38): 0->4 0.38
0 to 5 (0.73): 0->4 0.38  4->5 0.35
0 to 6 (0.52): 0->4 0.38  4->5 0.35  5->6 0.52
0 to 7 (0.60): 0->2 0.26  2->7 0.34
```
**SHORTEST PATHS**

- Edge-weighted digraph API
- Shortest-paths properties
- Dijkstra’s algorithm
- Edge-weighted DAGs
- Negative weights

**Data structures for single-source shortest paths**

**Goal.** Find the shortest path from $s$ to every other vertex.

**Observation.** A shortest-paths tree (SPT) solution exists. Why?

**Consequence.** Can represent the SPT with two vertex-indexed arrays:

- $\text{distTo}[v]$ is length of shortest path from $s$ to $v$.
- $\text{edgeTo}[v]$ is last edge on shortest path from $s$ to $v$.

```java
public double distTo(int v) {
    return distTo[v];
}

public Iterable<DirectedEdge> pathTo(int v) {
    Stack<DirectedEdge> path = new Stack<DirectedEdge>();
    for (DirectedEdge e = edgeTo[v]; e != null; e = edgeTo[e.from()])
        path.push(e);
    return path;
}
```

**Edge relaxation**

Relax edge $e = v \to w$.

- $\text{distTo}[v]$ is length of shortest known path from $s$ to $v$.
- $\text{distTo}[w]$ is length of shortest known path from $s$ to $w$.
- $\text{edgeTo}[w]$ is last edge on shortest known path from $s$ to $w$.
- If $e = v \to w$ gives shorter path to $w$ through $v$,
  update $\text{distTo}[w]$ and $\text{edgeTo}[w]$.
**Edge relaxation**

Relax edge \( e = v \rightarrow w \).
- \( \text{distTo}[v] \) is length of shortest known path from \( s \) to \( v \).
- \( \text{distTo}[w] \) is length of shortest known path from \( s \) to \( w \).
- \( \text{edgeTo}[w] \) is last edge on shortest known path from \( s \) to \( w \).
- If \( e = v \rightarrow w \) gives shorter path to \( w \) through \( v \), update \( \text{distTo}[w] \) and \( \text{edgeTo}[w] \).

```java
private void relax(DirectedEdge e) {
  int v = e.from(), w = e.to();
  if (distTo[w] > distTo[v] + e.weight()) {
    distTo[w] = distTo[v] + e.weight();
    edgeTo[w] = e;
  }
}
```

**Shortest-paths optimality conditions**

**Proposition.** Let \( G \) be an edge-weighted digraph.
Then \( \text{distTo}[] \) are the shortest path distances from \( s \) iff:
- For each vertex \( v \), \( \text{distTo}[v] \) is the length of some path from \( s \) to \( v \).
- For each edge \( e = v \rightarrow w \), \( \text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight()} \).

**Pf.** \( \Rightarrow \) [necessary]
- Suppose that \( \text{distTo}[w] > \text{distTo}[v] + e.\text{weight()} \) for some edge \( e = v \rightarrow w \).
- Then, \( e \) gives a path from \( s \) to \( w \) (through \( v \)) of length less than \( \text{distTo}[w] \).

**Proposition.** Generic algorithm computes SPT (if it exists) from \( s \).

**Pf.** Sketch.
- Throughout algorithm, \( \text{distTo}[v] \) is the length of a simple path from \( s \) to \( v \) (and \( \text{edgeTo}[v] \) is last edge on path).
- Each successful relaxation decreases \( \text{distTo}[v] \) for some \( v \).
- The entry \( \text{distTo}[v] \) can decrease at most a finite number of times.

**Generic shortest-paths algorithm**

**Generic algorithm (to compute SPT from \( s \))**

Initialize \( \text{distTo}[s] = 0 \) and \( \text{distTo}[v] = \infty \) for all other vertices.

Repeat until optimality conditions are satisfied:
- Relax any edge.
**Generic shortest-paths algorithm**

Generic algorithm (to compute SPT from s)

- Initialize distTo[s] = 0 and distTo[v] = $\infty$ for all other vertices.
- Repeat until optimality conditions are satisfied:
  - Relax any edge.

**Efficient implementations.** How to choose which edge to relax?

Ex 1. Dijkstra’s algorithm (nonnegative weights).
Ex 2. Topological sort algorithm (no directed cycles).
Ex 3. Bellman-Ford algorithm (no negative cycles).

---

**Edsger W. Dijkstra: select quotes**

“Do only what only you can do.”

“In their capacity as a tool, computers will be but a ripple on the surface of our culture. In their capacity as intellectual challenge, they are without precedent in the cultural history of mankind.”

“The use of COBOL cripples the mind; its teaching should, therefore, be regarded as a criminal offence.”

“It is practically impossible to teach good programming to students that have had a prior exposure to BASIC: as potential programmers they are mentally mutilated beyond hope of regeneration.”

“A PL is a mistake, carried through to perfection. It is the language of the future for the programming techniques of the past: it creates a new generation of coding bums.”
Dijkstra's algorithm

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest $distTo[]$ value).
- Add vertex to tree and relax all edges incident from that vertex.

an edge-weighted digraph

Dijkstra's algorithm

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest $distTo[]$ value).
- Add vertex to tree and relax all edges incident from that vertex.

choose source vertex 0

Dijkstra's algorithm

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest $distTo[]$ value).
- Add vertex to tree and relax all edges incident from that vertex.

relax all edges incident from 0

Dijkstra's algorithm

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest $distTo[]$ value).
- Add vertex to tree and relax all edges incident from that vertex.

relax all edges incident from 0
**Dijkstra’s algorithm**

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest $\text{distTo}[\cdot]$ value).
- Add vertex to tree and relax all edges incident from that vertex.

![Diagram showing Dijkstra’s algorithm steps](image)

1. **Choose vertex 1**
   - $\text{distTo}[1] = 5.0$
   - $\text{edgeTo}[1] = 0$

2. **Relax all edges incident from 1**
   - $\text{distTo}[2] = 7.0$
   - $\text{edgeTo}[2] = 1$
   - $\text{distTo}[3] = 9.0$
   - $\text{edgeTo}[3] = 0$
   - $\text{distTo}[4] = 9.0$
   - $\text{edgeTo}[4] = 0$
   - $\text{distTo}[5] = 8.0$
   - $\text{edgeTo}[5] = 0$
   - $\text{distTo}[6] = 8.0$
   - $\text{edgeTo}[6] = 0$
   - $\text{distTo}[7] = 8.0$
   - $\text{edgeTo}[7] = 0$

3. **Choose vertex 2**
   - $\text{distTo}[2] = 7.0$
   - $\text{edgeTo}[2] = 1$

4. **Relax all edges incident from 2**
   - $\text{distTo}[3] = 17.0$
   - $\text{edgeTo}[3] = 2$
   - $\text{distTo}[4] = 17.0$
   - $\text{edgeTo}[4] = 2$
   - $\text{distTo}[5] = 20.0$
   - $\text{edgeTo}[5] = 0$
   - $\text{distTo}[6] = 17.0$
   - $\text{edgeTo}[6] = 2$
   - $\text{distTo}[7] = 17.0$
   - $\text{edgeTo}[7] = 2$

5. **Choose vertex 3**
   - $\text{distTo}[3] = 17.0$
   - $\text{edgeTo}[3] = 2$

6. **Relax all edges incident from 3**
   - $\text{distTo}[2] = 17.0$
   - $\text{edgeTo}[2] = 3$
   - $\text{distTo}[1] = 17.0$
   - $\text{edgeTo}[1] = 0$
   - $\text{distTo}[5] = 20.0$
   - $\text{edgeTo}[5] = 0$
   - $\text{distTo}[6] = 17.0$
   - $\text{edgeTo}[6] = 2$
   - $\text{distTo}[7] = 17.0$
   - $\text{edgeTo}[7] = 2$

**Summary**

- The final distances from the source vertex $s$ to each vertex are:
  - $\text{distTo}[0] = 0.0$
  - $\text{distTo}[1] = 5.0$
  - $\text{distTo}[2] = 7.0$
  - $\text{distTo}[3] = 17.0$
  - $\text{distTo}[4] = 9.0$
  - $\text{distTo}[5] = 8.0$
  - $\text{distTo}[6] = 8.0$
  - $\text{distTo}[7] = 8.0$

- The edge to reach each vertex is:
  - $\text{edgeTo}[0] = -1$
  - $\text{edgeTo}[1] = 0$
  - $\text{edgeTo}[2] = 1$
  - $\text{edgeTo}[3] = 2$
  - $\text{edgeTo}[4] = 0$
  - $\text{edgeTo}[5] = 0$
  - $\text{edgeTo}[6] = 0$
  - $\text{edgeTo}[7] = 0$

The algorithm has converged, and the shortest paths from the source vertex $s$ have been calculated.
Dijkstra's algorithm

- Consider vertices in increasing order of distance from $s$ (non-tree vertex with the lowest distTo[] value).
- Add vertex to tree and relax all edges incident from that vertex.

\[

  - \( 7 \rightarrow 8.0 \rightarrow 0 \rightarrow 7 \)

shortest-paths tree from vertex \( s \)

**Dijkstra’s algorithm visualization**

**Dijkstra's algorithm: correctness proof**

**Proposition.** Dijkstra’s algorithm computes a SPT in any edge-weighted digraph with nonnegative weights.

**Pf.**
- Each edge \( e = v \rightarrow w \) is relaxed exactly once (when \( v \) is relaxed), leaving \( \text{distTo}[w] \leq \text{distTo}[v] + e.weight() \).
- Inequality holds until algorithm terminates because:
  - \( \text{distTo}[w] \) cannot increase
  - \( \text{distTo}[v] \) will not change
- Thus, upon termination, shortest-paths optimality conditions hold.
Dijkstra's algorithm: Java implementation

```java
public class DijkstraSP {
    private DirectedEdge[] edgeTo;
    private double[] distTo;
    private IndexMinPQ<Double> pq;

    public DijkstraSP(EdgeWeightedDigraph G, int s) {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];
        pq = new IndexMinPQ<Double>(G.V());
        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;
        pq.insert(s, 0.0);
        while (!pq.isEmpty()) {
            int v = pq.delMin();
            for (DirectedEdge e : G.adj(v))
                relax(e);
        }
    }
}
```

relax vertices in order of distance from s

private void relax(DirectedEdge e) {
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight()) {
        distTo[w] = distTo[v] + e.weight();
        edgeTo[w] = e;
        if (pq.contains(w)) pq.decreaseKey(w, distTo[w]);
        else pq.insert(w, distTo[w]);
    }
}

update PQ

Dijkstra's algorithm: which priority queue?

Depends on PQ implementation: \( V \) insert, \( V \) delete-min, \( E \) decrease-key.

</table>

Bottom line.
- Array implementation optimal for dense graphs.
- Binary heap much faster for sparse graphs.
- d-way heap worth the trouble in performance-critical situations.
- Fibonacci heap best in theory, but not worth implementing.

Priority-first search

Insight. Four of our graph-search methods are the same algorithm!
- Maintain a set of explored vertices \( S \).
- Grow \( S \) by exploring edges with exactly one endpoint leaving \( S \).

DFS. Take edge from vertex which was discovered most recently.
BFS. Take edge from vertex which was discovered least recently.
Prim. Take edge of minimum weight.
Dijkstra. Take edge to vertex that is closest to \( S \).

Challenge. Express this insight in reusable Java code.
Shortest Paths

- Edge-weighted digraph API
- Shortest-paths properties
- Dijkstra’s algorithm
- Edge-weighted DAGs
- Negative weights

Acyclic edge-weighted digraphs

Q. Suppose that an edge-weighted digraph has no directed cycles. Is it easier to find shortest paths than in a general digraph?

A. Yes!

Topological sort algorithm

- Consider vertices in topological order.
- Relax all edges incident from that vertex.

an edge-weighted DAG

```

- shortest-paths tree from vertex s

**Proposition.** Topological sort algorithm computes SPT in any edge-weighted DAG in time proportional to $E + V$.

**Pf.**

- Each edge $e = v \rightarrow w$ is relaxed exactly once (when $v$ is relaxed), leaving $\text{distTo}[w] \leq \text{distTo}[v] + e \cdot \text{weight}()$.
- Inequality holds until algorithm terminates because:
  - $\text{distTo}[w]$ cannot increase
  - $\text{distTo}[v]$ will not change

- Thus, upon termination, shortest-paths optimality conditions hold.

---

**Content-aware resizing**

**Seam carving.** [Avidan and Shamir] Resize an image without distortion for display on cell phones and web browsers.

**Seam carving.** [Avidan and Shamir] Resize an image without distortion for display on cell phones and web browsers.

**In the wild.** Photoshop CS 5, Imagemagick, GIMP, ...
To find vertical seam:
- Grid DAG: vertex = pixel; edge = from pixel to 3 downward neighbors.
- Weight of pixel = energy function of 8 neighboring pixels.
- Seam = shortest path from top to bottom.

To remove vertical seam:
- Delete pixels on seam (one in each row).
**Longest paths in edge-weighted DAGs**

Formulate as a shortest paths problem in edge-weighted DAGs.
- Negate all weights.
- Find shortest paths.
- Negate weights in result.

### Key point.
Topological sort algorithm works even with negative edge weights.

**Critical path method**

**CPM.** To solve a parallel job-scheduling problem, create edge-weighted DAG:
- Source and sink vertices.
- Two vertices (begin and end) for each job.
- Three edges for each job.
  - begin to end (weighted by duration)
  - source to begin (0 weight)
  - end to sink (0 weight)
- One edge for each precedence constraint (0 weight).

**CPM.** Use longest path from the source to schedule each job.
**Shortest Paths**

- Edge-weighted digraph API
- Shortest-paths properties
- Dijkstra’s algorithm
- Edge-weighted DAGs
- Negative weights

**Negative weights**

Dijkstra. Doesn’t work with negative edge weights.

Dijkstra selects vertex 3 immediately after 0. But shortest path from 0 to 3 is 0→1→2→3.

Re-weighting. Add a constant to every edge weight doesn’t work.

Adding 9 to each edge weight changes the shortest path from 0→1→2→3 to 0→3.

Bad news. Need a different algorithm.

**Negative cycles**

**Def.** A negative cycle is a directed cycle whose sum of edge weights is negative.

```
4→5 0.35
5→4 -0.66
4→7 0.37
5→7 0.28
7→5 0.28
5→1 0.32
0→4 0.38
0→2 0.26
7→3 0.39
1→3 0.29
2→7 0.34
6→2 0.40
3→6 0.52
6→0 0.58
6→4 0.91
```

Negative cycle (-0.66 + 0.37 + 0.28)

```
4→5→7→5
```

Shortest path from 0 to 6 assuming all vertices reachable from s

**Proposition.** A SPT exists iff no negative cycles.

**Bellman-Ford algorithm**

**Bellman–Ford algorithm**

Initialize distTo[s] = 0 and distTo[v] = ∞ for all other vertices.

Repeat V times:
- Relax each edge.

```
for (int i = 0; i < G.V(); i++)
for (int v = 0; v < G.V(); v++)
for (DirectedEdge e : G.adj(v))
relax(e);
```

Bellman-Ford algorithm visualization

Bellman-Ford algorithm visualization
Proposition. Dynamic programming algorithm computes SPT in any edge-weighted digraph with no negative cycles in time proportional to $E \times V$.

Pf idea. After pass $i$, found shortest path containing at most $i$ edges.

Bellman-Ford algorithm: analysis

Bellman-Ford algorithm

Initialize $\text{distTo}[s] = 0$ and $\text{distTo}[v] = \infty$ for all other vertices.
Repeat $V$ times:
  - Relax each edge.

Bellman-Ford algorithm: practical improvement

Observation. If $\text{distTo}[v]$ does not change during pass $i$, no need to relax any edge pointing from $v$ in pass $i + 1$.

FIFO implementation. Maintain queue of vertices whose $\text{distTo}[v]$ changed.

Be careful to keep at most one copy of each vertex on queue (why?)

Overall effect.
- The running time is still proportional to $E \times V$ in worst case.
- But much faster than that in practice.

Bellman-Ford algorithm: Java implementation

```java
class BellmanFordSP
{
  private double[] distTo;
  private DirectedEdge[] edgeTo;
  private boolean[] onQ;
  private Queue<Integer> queue;
  public BellmanFordSPT(EdgeWeightedDigraph G, int s)
  {  
    distTo = new double[G.V()];
    edgeTo = new DirectedEdge[G.V()];
    onQ = new boolean[G.V()];
    queue = new Queue<Integer>();
    for (int v = 0; v < V; v++)
      distTo[v] = Double.POSITIVE_INFINITY;
    distTo[s] = 0.0;
    queue.enqueue(s);
    while (!queue.isEmpty())
    {
      int v = queue.dequeue();
      onQ[v] = false;
      for (DirectedEdge e : G.adj(v))
        relax(e);
    }
  }

  private void relax(DirectedEdge e)
  {  
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {  
      distTo[w] = distTo[v] + e.weight();
      edgeTo[w] = e;
      if (!onQ[w])
      {  
        queue.enqueue(w);
        onQ[w] = true;
      }
    }
  }
}
```

Remark 1. Directed cycles make the problem harder.
Remark 2. Negative weights make the problem harder.
Remark 3. Negative cycles makes the problem intractable.

Finding a negative cycle

Negative cycle. Add two method to the API for `SP`.

```java
boolean hasNegativeCycle(); // is there a negative cycle?
Iterable<DirectedEdge> negativeCycle(); // negative cycle reachable from s
```

digraph
4->5 0.35
5->4 -0.66
4->7 0.37
5->7 0.28
7->5 0.32
5->4 0.38
0->2 0.26
7->3 0.39
3->3 0.29
2->7 0.34
6->2 0.40
3->6 0.52
6->0 0.58
6->4 0.93

An edge-weighted digraph with a negative cycle
4->5 0.35
5->4 -0.66
4->7 0.37
5->7 0.28
7->5 0.28
5->1 0.32
0->4 0.38
0->2 0.26
7->3 0.39
3->3 0.29
2->7 0.34
6->2 0.40
3->6 0.52
6->0 0.58
6->4 0.93

digraph 5->4->7->5
negative cycle (-0.66 + 0.37 + 0.28)

Finding a negative cycle

Observation. If there is a negative cycle, Bellman-Ford gets stuck in loop, updating `distTo[]` and `edgeTo[]` entries of vertices in the cycle.

Proposition. If any vertex \( v \) is updated in phase \( V' \), there exists a negative cycle (and can trace back `edgeTo[v]` entries to find it).

In practice. Check for negative cycles more frequently.

Negative cycle application: arbitrage detection

Problem. Given table of exchange rates, is there an arbitrage opportunity?

<table>
<thead>
<tr>
<th></th>
<th>USD</th>
<th>EUR</th>
<th>GBP</th>
<th>CHF</th>
<th>CAD</th>
</tr>
</thead>
<tbody>
<tr>
<td>USD</td>
<td>1</td>
<td>0.741</td>
<td>0.657</td>
<td>1.061</td>
<td>1.011</td>
</tr>
<tr>
<td>EUR</td>
<td>1.35</td>
<td>1</td>
<td>0.888</td>
<td>1.433</td>
<td>1.366</td>
</tr>
<tr>
<td>GBP</td>
<td>1.521</td>
<td>1.126</td>
<td>1</td>
<td>1.614</td>
<td>1.538</td>
</tr>
<tr>
<td>CHF</td>
<td>0.943</td>
<td>0.698</td>
<td>0.62</td>
<td>1</td>
<td>0.953</td>
</tr>
<tr>
<td>CAD</td>
<td>0.995</td>
<td>0.732</td>
<td>0.65</td>
<td>1.049</td>
<td>1</td>
</tr>
</tbody>
</table>

Ex. $1,000 \Rightarrow 741$ Euros \( \Rightarrow 1,012.206 \) Canadian dollars \( \Rightarrow 1,007.14497 \).

\[ 1000 \times 0.741 \times 1.366 \times 0.995 = 1007.14497 \]

Currency exchange graph.

- Vertex = currency.
- Edge = transaction, with weight equal to exchange rate.
- Find a directed cycle whose product of edge weights is \( > 1 \).

Challenge. Express as a negative cycle detection problem.
Negative cycle application: arbitrage detection

Model as a negative cycle detection problem by taking logs.
- Let weight of edge $v \rightarrow w$ be $-\ln$ (exchange rate from currency $v$ to $w$).
- Multiplication turns to addition; $>1$ turns to $<0$.
- Find a directed cycle whose sum of edge weights is $<0$ (negative cycle).

Remark. Fastest algorithm is extraordinarily valuable!

Shortest paths summary

Dijkstra's algorithm.
- Nearly linear-time when weights are nonnegative.
- Generalization encompasses DFS, BFS, and Prim.

Acyclic edge-weighted digraphs.
- Arise in applications.
- Faster than Dijkstra's algorithm.
- Negative weights are no problem.

Negative weights and negative cycles.
- Arise in applications.
- If no negative cycles, can find shortest paths via Bellman-Ford.
- If negative cycles, can find one via Bellman-Ford.

Shortest-paths is a broadly useful problem-solving model.
