Student ID:

Question:	1	2	3	4	5	6	7	Total
Points:	8	25	12	10	12	15	18	100
Score:								

1. (8 points) Find the solution to the recurrence relation $a_n = 2a_{n-2}$, where the initial conditions are $a_0 = 3$ and $a_1 = 5$.

2. In the following questions, please give your answer without needing to evaluate the formula.

(a) (5 points) In how many ways can $3n$ students be broken up into n groups of 3?

(b) (5 points) How many $m \times n$ matrices are there with distinct entries drawn from $\{1, \dots, p\}$, where $p \geq mn$?

(c) (5 points) How many different paths are there in a coordinate system from $(0, 0)$ to $(5, 15)$ consisting of right-steps (which increases the first coordinate by one) and up-steps (which increases the second coordinate by one)?

(d) (5 points) How many solutions with **positive integers** are there for the inequality $x_1 + x_2 + \dots + x_8 \leq 78$.

(e) (5 points) How many undirected simple (no loops or multiple edges) graphs are there with vertices labelled as v_1, v_2, \dots, v_n ?

3. We want to write words can be written by using the letters $A, C, E, G, H, K, L, M, N, T, U$. Please answer the following questions without evaluating the formula.
- (a) (4 points) How many words contain the subword “MATH”?

 - (b) (4 points) How many words contain both of the subwords “MATH” and “CLEAN”?

 - (c) (4 points) How many words can be written without containing the word “MATH” and “CLEAN”?
4. (10 points) Solve the recurrence relation $a_n = 7a_{n-1} - 10a_{n-2}$ with initial conditions $a_0 = 5$ and $a_1 = 16$.

5. (12 points) Solve the recurrence relation $a_n = 3a_{n-1} + 2^n$ with the initial condition $a_0 = 2$.

6. Let a_n be the number of ways to climb n stairs if the person climbing the stairs can take one stair or three stairs at a time.

(a) (5 points) Find a recurrence relation for a_n . Explain your answer.

(b) (5 points) What are the initial conditions?

(c) (5 points) How many ways can this person climb a flight of 10 stairs?

7. Prove the following statements by using the Generalized Pigeonhole Principle. For each problem, try to identify the pigeons and the pigeonholes.

(a) (5 points) In a room of 1000 people, there are three people who share the same birthday.

(b) (6 points) In every set of 150 integers, there exist two whose difference is a multiple of 67.

(c) (7 points) Jellybeans of 6 different flavors are stored in 5 jars. There are 11 jellybeans of each flavor. Prove that some jar contains at least three jellybeans of one flavor and also at least three jellybeans of some other flavor.
