FUNDAMENTALS OF COMPUTATIONAL PHOTOGRAPHY

Lecture #06 – Gradient-Domain Image Processing

HACETTEPE
UNIVERSITY
COMPUTER
VISION LAB

Erkut Erdem // Hacettepe University // Spring 2025

Today's Lecture

- Gradient-domain image processing
- Basics on images and gradients
- Integrable vector fields
- Poisson blending
- Flash/no-flash photography
- Gradient-domain rendering and cameras

Disclaimer: The material and slides for this lecture were borrowed from

—Ioannis Gkioulekas' 15-463/15-663/15-862 "Computational Photography" class

—Amit Agrawal's slides on "Gradient-Domain Based Flash/No-flash Photography"

—Adrien Gruson's slides on "Gradient-Domain Rendering"

—Davide Scaramuzza's tutorial on "Event-based Cameras"

Basics of gradients and fields

Some vector calculus definitions in 2D

Scalar field: a function assigning a scalar to every point in space.

$$I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

Vector field: a function assigning a vector to every point in space.

$$[u(x, y) \quad v(x, y)]: \mathbb{R}^2 \rightarrow \mathbb{R}^2$$

Can you think of examples of scalar fields and vector fields?

Some vector calculus definitions in 2D

Scalar field: a function assigning a scalar to every point in space.

$$I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

Vector field: a function assigning a vector to every point in space.

$$[u(x, y) \quad v(x, y)]: \mathbb{R}^2 \rightarrow \mathbb{R}^2$$

Can you think of examples of scalar fields and vector fields?

- A grayscale image is a scalar field.
- A two-channel image is a vector field.
- A three-channel (e.g., RGB) image is also a vector field, but of higher-dimensional range than what we will consider here.

Some vector calculus definitions in 2D

Nabla (or del): vector differential operator.

$$\nabla = \begin{bmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} \end{bmatrix}$$

Think of this as
a 2D vector.

Some vector calculus definitions in 2D

Nabla (or del): vector differential operator.

$$\nabla = \begin{bmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} \end{bmatrix}$$

Think of this as
a 2D vector.

Gradient (grad): product of nabla with a scalar field.

$$\nabla I(x, y) = ?$$

Divergence: inner product of nabla with a vector field.

$$\nabla \cdot [u(x, y) \quad v(x, y)] = ?$$

Curl: cross product of nabla with a vector field.

$$\nabla \times [u(x, y) \quad v(x, y)] = ?$$

Some vector calculus definitions in 2D

Nabla (or del): vector differential operator.

$$\nabla = \begin{bmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} \end{bmatrix}$$

Think of this as
a 2D vector.

Gradient (grad): product of nabla with a scalar field.

$$\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$$

What is the
dimension of this?

Divergence: inner product of nabla with a vector field.

$$\nabla \cdot [u(x, y) \quad v(x, y)] = \frac{\partial u}{\partial x}(x, y) + \frac{\partial v}{\partial y}(x, y)$$

What is the
dimension of this?

Curl: cross product of nabla with a vector field.

$$\nabla \times [u(x, y) \quad v(x, y)] = \left(\frac{\partial v}{\partial x}(x, y) - \frac{\partial u}{\partial y}(x, y) \right) \hat{k}$$

What is the
dimension of this?

Some vector calculus definitions in 2D

Nabla (or del): vector differential operator.

$$\nabla = \begin{bmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} \end{bmatrix}$$

Think of this as
a 2D vector.

Gradient (grad): product of nabla with a scalar field.

$$\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$$

This is a
vector field.

Divergence: inner product of nabla with a vector field.

$$\nabla \cdot [u(x, y) \quad v(x, y)] = \frac{\partial u}{\partial x}(x, y) + \frac{\partial v}{\partial y}(x, y)$$

This is a
scalar field.

Curl: cross product of nabla with a vector field.

$$\nabla \times [u(x, y) \quad v(x, y)] = \left(\frac{\partial v}{\partial x}(x, y) - \frac{\partial u}{\partial y}(x, y) \right) \hat{k}$$

This is a vector field.

Some vector calculus definitions in 2D

Nabla (or del): vector differential operator.

$$\nabla = \begin{bmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} \end{bmatrix}$$

Think of this as
a 2D vector.

Gradient (grad): product of nabla with a scalar field.

$$\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$$

This is a
vector field.

Divergence: inner product of nabla with a vector field.

$$\nabla \cdot [u(x, y) \quad v(x, y)] = \frac{\partial u}{\partial x}(x, y) + \frac{\partial v}{\partial y}(x, y)$$

This is a
scalar field.

Curl: cross product of nabla with a vector field.

$$\nabla \times [u(x, y) \quad v(x, y)] = \left(\frac{\partial v}{\partial x}(x, y) - \frac{\partial u}{\partial y}(x, y) \right) \hat{k}$$

This is a vector field.
This is a scalar field.

Combinations

Curl of the gradient:

$$\nabla \times \nabla I(x, y) = ?$$

Divergence of the gradient:

$$\nabla \cdot \nabla I(x, y) = ?$$

Combinations

Curl of the gradient:

$$\nabla \times \nabla I(x, y) = \frac{\partial^2}{\partial y \partial x} I(x, y) - \frac{\partial^2}{\partial x \partial y} I(x, y)$$

Divergence of the gradient:

$$\nabla \cdot \nabla I(x, y) = \frac{\partial^2}{\partial x^2} I(x, y) + \frac{\partial^2}{\partial y^2} I(x, y) \equiv \Delta I(x, y)$$

Laplacian: scalar differential operator.

$$\Delta \equiv \nabla \cdot \nabla = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$$

Inner product of
del with itself!

Simplified notation

Nabla (or del): vector differential operator.

$$\nabla = [\quad x \quad y]$$

Think of this as
a 2D vector.

Gradient (grad): product of nabla with a scalar field.

$$\nabla I = [I_x \quad I_y]$$

This is a
vector field.

Divergence: inner product of nabla with a vector field.

$$\nabla \cdot [u \quad v] = u_x + v_y$$

This is a
scalar field.

Curl: cross product of nabla with a vector field.

$$\nabla \times [u \quad v] = (v_x - u_y) \hat{k}$$

This is a vector field.
This is a scalar field.

Simplified notation

Curl of the gradient:

$$\nabla \times \nabla I = I_{yx} - I_{xy}$$

Divergence of the gradient:

$$\nabla \cdot \nabla I = I_{xx} + I_{yy} \equiv \Delta I$$

Laplacian: scalar differential operator.

$$\Delta \equiv \nabla \cdot \nabla = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$$

Inner product of
del with itself!

Image representation

We can treat grayscale images as scalar fields (i.e., two dimensional functions)

$$I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$

vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$ \longrightarrow vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

- How do we do this differentiation in real discrete images?

Finite differences

High-school reminder: definition of a derivative using forward difference.

$$\frac{\partial I}{\partial x}(x, y) = \lim_{h \rightarrow 0} \frac{I(x + h, y) - I(x, y)}{h}$$

For discrete scalar fields: remove limit and set $h = 1$.

$$\frac{\partial I}{\partial x}(x, y) = I(x + 1, y) - I(x, y)$$

What convolution kernel does this correspond to?

Finite differences

High-school reminder: definition of a derivative using forward difference.

$$\frac{\partial I}{\partial x}(x, y) = \lim_{h \rightarrow 0} \frac{I(x + h, y) - I(x, y)}{h}$$

For discrete scalar fields: remove limit and set $h = 1$.

$$\frac{\partial I}{\partial x}(x, y) = I(x + 1, y) - I(x, y)$$

-1	1	?
1	-1	?

Finite differences

High-school reminder: definition of a derivative using forward difference.

$$\frac{\partial I}{\partial x}(x, y) = \lim_{h \rightarrow 0} \frac{I(x + h, y) - I(x, y)}{h}$$

For discrete scalar fields: remove limit and set $h = 1$.

$$\frac{\partial I}{\partial x}(x, y) = I(x + 1, y) - I(x, y)$$

partial-x derivative filter

1	-1
---	----

Note: common to use central difference, but we will not use it in this lecture.

$$\frac{\partial I}{\partial x}(x, y) = \frac{I(x + 1, y) - I(x - 1, y)}{2}$$

Finite differences

High-school reminder: definition of a derivative using forward difference.

$$\frac{\partial I}{\partial x}(x, y) = \lim_{h \rightarrow 0} \frac{I(x + h, y) - I(x, y)}{h}$$

For discrete scalar fields: remove limit and set $h = 1$.

$$\frac{\partial I}{\partial x}(x, y) = I(x + 1, y) - I(x, y)$$

partial-x derivative filter

1	-1
---	----

Similarly for partial-y derivative.

$$\frac{\partial I}{\partial y}(x, y) = I(x, y + h) - I(x, y)$$

partial-y derivative filter

1
-1

Discrete Laplacian

How do we compute the image Laplacian?

$$\Delta I(x, y) = \frac{\partial^2 I}{\partial x^2}(x, y) + \frac{\partial^2 I}{\partial y^2}(x, y)$$

Discrete Laplacian

How do we compute the image Laplacian?

$$\Delta I(x, y) = \frac{\partial^2 I}{\partial x^2}(x, y) + \frac{\partial^2 I}{\partial y^2}(x, y)$$

Use multiple applications of the discrete derivative filters:

$$\underbrace{\begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array} * \begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array}}_{\text{What is this?}} + \underbrace{\begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array} * \begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array}}_{\text{What is this?}} = ?$$

What is this?

What is this?

Discrete Laplacian

How do we compute the image Laplacian?

$$\Delta I(x, y) = \frac{\partial^2 I}{\partial x^2}(x, y) + \frac{\partial^2 I}{\partial y^2}(x, y)$$

Use multiple applications of the discrete derivative filters:

$$\underbrace{\begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array} * \begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array}}_{\frac{\partial^2 I}{\partial x^2}(x, y)} + \underbrace{\begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array} * \begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array}}_{\frac{\partial^2 I}{\partial y^2}(x, y)} =$$

Laplacian filter

0	1	0
1	-4	1
0	1	0

Discrete Laplacian

How do we compute the image Laplacian?

$$\Delta I(x, y) = \frac{\partial^2 I}{\partial x^2}(x, y) + \frac{\partial^2 I}{\partial y^2}(x, y)$$

Very important to:

- use consistent derivative and Laplacian filters.
- account for boundary shifting and padding from convolution.

Use multiple applications of the discrete derivative filters:

$$\underbrace{\begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array} * \begin{array}{|c|c|} \hline 1 & -1 \\ \hline \end{array}}_{\frac{\partial^2 I}{\partial x^2}(x, y)} + \underbrace{\begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array} * \begin{array}{|c|} \hline 1 \\ \hline -1 \\ \hline \end{array}}_{\frac{\partial^2 I}{\partial y^2}(x, y)} =$$

Laplacian filter

0	1	0
1	-4	1
0	1	0

Warning!

Very important for the techniques discussed in this lecture to:

- use consistent derivative and Laplacian filters.
- account for boundary shifting and padding from convolution.

A correct implementation of differential operators should pass the following test:

Equality holds at all pixels except boundary
(first and last row, first and last column).

$$\underbrace{\nabla \cdot (\nabla (\text{img}))}_{\text{divergence operator}} = \underbrace{\Delta (\text{img})}_{\text{Laplacian operator}}$$

Typically requires implementing derivatives in various differential operators differently.

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$

vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$ \longrightarrow vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

- Image gradients are very informative!

Application - Seam Carving

[Shai & Avidan, SIGGRAPH 2007]

Application - Seam Carving

Content-aware resizing

Traditional resizing

[Shai & Avidan, SIGGRAPH 2007]

Application - Seam Carving

Shai Avidan
Mitsubishi Electric Research Lab
Ariel Shamir
The interdisciplinary Center & MERL

Seam Carving: Main idea

Content-aware resizing

Intuition:

- Preserve the most “interesting/important” content
→ Prefer to remove pixels with low gradient energy
- To reduce or increase size in one dimension, remove irregularly shaped “seams”
→ Optimal solution via dynamic programming.

Seam Carving: Main idea

$$Energy(f) = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

- Want to remove seams where they won't be very noticeable:
- Measure "energy" as gradient magnitude
- Choose seam based on **minimum total energy path** across image, subject to 8-connectedness.

Seam Carving: Algorithm

$$Energy(f) = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

- Let a **vertical seam** \mathbf{s} consist of h positions that form an 8-connected path.
- Let the **cost of a seam** be: $Cost(\mathbf{s}) = \sum_{i=1}^h Energy(f(s_i))$
- **Optimal seam** minimizes this cost.
- Compute it efficiently with **dynamic programming**: $\mathbf{s}^* = \min_{\mathbf{s}} Cost(\mathbf{s})$

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$

vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

Image gradients

Convert the scalar field into a vector field through differentiation.

scalar field $I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$ \longrightarrow vector field $\nabla I(x, y) = \begin{bmatrix} \frac{\partial I}{\partial x}(x, y) & \frac{\partial I}{\partial y}(x, y) \end{bmatrix}$

- How do we do this differentiation in real discrete images?
- Can we go in the opposite direction, from gradients to images?

Vector field integration

Two fundamental questions:

- When is integration of a vector field possible?
- How can integration of a vector field be performed?

Integrable vector fields

Integrable fields

Given an arbitrary vector field (u, v) , can we always integrate it into a scalar field I ?

$$I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

$$u(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

$$v(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

such that

$$\frac{\partial I}{\partial x}(x, y) = u(x, y)$$

$$\frac{\partial I}{\partial y}(x, y) = v(x, y)$$

Property of twice-differentiable functions

Curl of the gradient field should be zero:

$$\nabla \times \nabla I = I_{yx} - I_{xy} = 0$$

What does that mean intuitively?

Property of twice-differentiable functions

Curl of the gradient field should be zero:

$$\nabla \times \nabla I = I_{yx} - I_{xy} = 0$$

What does that mean intuitively?

- Same result independent of order of differentiation.

$$I_{yx} = I_{xy}$$

Demonstration

image I

I_x

I_y

ΔI

$\nabla \times \nabla I$

I_{xy}

=

I_{yx}

Property of twice-differentiable functions

Curl of the gradient field should be zero:

$$\nabla \times \nabla I = I_{yx} - I_{xy} = 0$$

What does that mean intuitively?

- Same result independent of order of differentiation.

$$I_{yx} = I_{xy}$$

Can you use this property to derive an integrability condition?

Integrable fields

Given an arbitrary vector field (u, v) , can we always integrate it into a scalar field I ?

$$I(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

such that

$$\frac{\partial I}{\partial x}(x, y) = u(x, y)$$
$$\frac{\partial I}{\partial y}(x, y) = v(x, y)$$

$$u(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

$$v(x, y): \mathbb{R}^2 \rightarrow \mathbb{R}$$

Only if:

$$\nabla \times \begin{bmatrix} u(x, y) \\ v(x, y) \end{bmatrix} = 0 \Rightarrow \frac{\partial u}{\partial y}(x, y) = \frac{\partial v}{\partial x}(x, y)$$

Vector field integration

Two fundamental questions:

- When is integration of a vector field possible?
 - Use curl to check for equality of mixed partial second derivatives.
- How can integration of a vector field be performed?

Different types of integration problems

- Reconstructing height fields from gradients
Applications: shape from shading, photometric stereo
- Manipulating image gradients
Applications: tonemapping, image editing, matting, fusion, mosaics
- Manipulation of 3D gradients
Applications: mesh editing, video operations

Key challenge: Most vector fields in applications are not integrable.

- Integration must be done approximately.

A prototypical integration problem: Poisson blending

Application: Poisson blending

originals

copy-paste

Poisson blending

Key idea

When blending, retain the gradient information as best as possible

source

destination

copy-paste

Poisson blending

Definitions and notation

Notation

g : source function

S : destination

Ω : destination domain

f : interpolant function

f^* : destination function

Which one is the unknown?

Definitions and notation

Notation

g : source function

S : destination

Ω : destination domain

f : interpolant function

f^* : destination function

How should we determine f ?

- Should it be similar to g ?
- Should it be similar to f^* ?

g

Definitions and notation

Notation

g : source function

S : destination

Ω : destination domain

f : interpolant function

f^* : destination function

Find f such that:

- $\nabla f = \nabla g$ inside Ω .
- $f = f^*$ at the boundary $\partial\Omega$.

g

Poisson blending: integrate vector field ∇g with Dirichlet boundary conditions f^* .

Least-squares integration and the Poisson problem

Least-squares integration

“Variational” means optimization where the unknown is an entire function

Variational problem

$$\min_f \iint_{\Omega} |\nabla f - \mathbf{v}|^2 \quad \text{with} \quad f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

what does this term do?

what does this term do?

Recall ...

Nabla operator definition

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

is this known?

$$\mathbf{v} = (u, v)$$

Least-squares integration

“Variational” means optimization where the unknown is an entire function

Variational problem

$$\min_f \iint_{\Omega} |\nabla f - \mathbf{v}|^2 \quad \text{with} \quad f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

gradient of f looks like vector field \mathbf{v}

f is equivalent to f^* at the boundaries

Why do we need boundary conditions for least-squares integration?

Recall ...

Nabla operator definition

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

Yes, this is the vector field we are integrating

$$\mathbf{v} = (u, v)$$

Equivalently

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

what does this term do?

This can be derived using the Euler-Lagrange equation.

Recall ...

Laplacian $\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$

Divergence $\operatorname{div} \mathbf{v} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y}$

Input vector field:

$$\mathbf{v} = (u, v)$$

Equivalently

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Laplacian of f same as
divergence of vector field \mathbf{v}

Recall ...

Laplacian $\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$

Divergence $\operatorname{div} \mathbf{v} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y}$

Input vector field:

$$\mathbf{v} = (u, v)$$

This can be
derived
using the
Euler-
Lagrange
equation.

In the Poisson blending example...

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Find f such that:

- $\nabla f = \nabla g$ inside Ω .
- $f = f^*$ at the boundary $\partial\Omega$.

What does the input vector field equal in Poisson blending?

$$\mathbf{v} = (u, v) =$$

In the Poisson blending example...

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Find f such that:

- $\nabla f = \nabla g$ inside Ω .
- $f = f^*$ at the boundary $\partial\Omega$.

What does the input vector field equal in Poisson blending?

$$\mathbf{v} = (u, v) = \nabla g$$

What does the divergence of the input vector field equal in Poisson blending?

$$\operatorname{div} \mathbf{v} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} =$$

In the Poisson blending example...

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Find f such that:

- $\nabla f = \nabla g$ inside Ω .
- $f = f^*$ at the boundary $\partial\Omega$.

so make these ...

What does the input vector field equal in Poisson blending?

$$\mathbf{v} = (u, v) = \nabla g$$

What does the divergence of the input vector field equal in Poisson blending?

$$\operatorname{div} \mathbf{v} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = \Delta g$$

Equivalently

The stationary point of the variational loss is the solution to the:

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

How do we solve the Poisson equation?

Recall ...

Laplacian $\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$

Divergence $\operatorname{div} \mathbf{v} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y}$

Input vector field:

$$\mathbf{v} = (u, v)$$

Discretization of the Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Recall ...

Laplacian
filter

0	1	0
1	-4	1
0	1	0

partial-x
derivative filter

1	-1
---	----

partial-y
derivative filter

1
-1

So for each pixel, do:

$$(\Delta f)(x, y) = (\nabla \cdot \mathbf{v})(x, y)$$

Or for discrete images:

Discretization of the Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Recall ...

Laplacian
filter

0	1	0
1	-4	1
0	1	0

partial-x
derivative filter

1	-1
---	----

partial-y
derivative filter

1
-1

So for each pixel, do:

$$(\Delta f)(x, y) = (\nabla \cdot \mathbf{v})(x, y)$$

Or for discrete images:

$$\begin{aligned} & -4f(x, y) + f(x + 1, y) + f(x - 1, y) \\ & \quad + f(x, y + 1) + f(x, y - 1) \\ & = u(x + 1, y) - u(x, y) + v(x, y + 1) \\ & \quad - v(x, y) \end{aligned}$$

Discretization of the Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

Recall ...

Laplacian
filter

1	-4	1
0	1	0

partial-x
derivative filter

1	-1
---	----

partial-y
derivative filter

1
-1

So for each pixel, do (more compact notation):

$$(\Delta f)_p = (\nabla \cdot \mathbf{v})_p$$

Or for discrete images (more compact notation):

$$-4f_p + \sum_{q \in N_p} f_q = (u_x)_p + (v_y)_p$$

We can rewrite this as

linear equation
of P variables

$$-4f_p + \sum_{q \in N_p} f_q = (u_x)_p + (v_y)_p$$

one for each
pixel $p = 1, \dots, P$

In vector form:

(each pixel adds another 'sparse' row here)

$$\underbrace{\begin{bmatrix} \vdots & & & & & & & & & & \\ 0 & \dots & 1 & \dots & 1 & -4 & 1 & \dots & 1 & \dots & 0 \\ \vdots & & & & & & & & & & \end{bmatrix}}_A \cdot \underbrace{\begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_P \end{bmatrix}}_f = \underbrace{\begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_P \end{bmatrix}}_b$$

We can rewrite this as

linear equation
of P variables

$$-4f_p + \sum_{q \in N_p} f_q = (u_x)_p + (v_y)_p$$

one for each
pixel $p = 1, \dots, P$

In vector form:

(each pixel adds another 'sparse' row here)

$$\begin{matrix} \rightarrow & \begin{bmatrix} \vdots \\ 0 & \dots & 1 & \dots & 1 & -4 & 1 & \dots & 1 & \dots & 0 \\ \vdots \end{bmatrix} & \cdot & \underbrace{\begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_P \end{bmatrix}}_f & = & \underbrace{\begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_P \end{bmatrix}}_b \end{matrix}$$

what is
this?

what are the sizes of these?

A

f

b

We can rewrite this as

linear equation
of P variables

$$-4f_p + \sum_{q \in N_p} f_q = (u_x)_p + (v_y)_p$$

one for each
pixel $p = 1, \dots, P$

In vector form:

(each pixel adds another 'sparse' row here)

$$\underbrace{\begin{bmatrix} \vdots & & & & & & & & & & \\ 0 & \dots & 1 & \dots & 1 & -4 & 1 & \dots & 1 & \dots & 0 \\ \vdots & & & & & & & & & & \end{bmatrix}}_A \cdot \underbrace{\begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_P \end{bmatrix}}_f = \underbrace{\begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_P \end{bmatrix}}_b$$

We call this the
Laplacian matrix

Laplacian matrix

For a $m \times n$ image, we can re-organize this matrix into block tridiagonal form as:

$$A_{mn \times mn} = \begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix}$$

This requires ordering pixels in column-major order.

$I_{m \times m}$ is the $m \times m$ identity matrix

$$D_{m \times m} =$$

$$\begin{bmatrix} -4 & 1 & 0 & 0 & 0 & \dots & 0 \\ 1 & -4 & 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & -4 & 1 & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & 1 & -4 & 1 & 0 \\ 0 & \dots & \dots & 0 & 1 & -4 & 1 \\ 0 & \dots & \dots & \dots & 0 & 1 & -4 \end{bmatrix}$$

Discrete Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$Af = b$$

How would you solve this?

WARNING: requires special treatment at the borders
(target boundary values are same as source)

Solving the linear system

Convert the system to a linear least-squares problem:

$$E_{LLS} = \|\mathbf{A}f - \mathbf{b}\|^2$$

Expand the error:

$$E_{LLS} = f^\top (\mathbf{A}^\top \mathbf{A})f - 2f^\top (\mathbf{A}^\top \mathbf{b}) + \|\mathbf{b}\|^2$$

Minimize the error:

Set derivative to 0 $(\mathbf{A}^\top \mathbf{A})f = \mathbf{A}^\top \mathbf{b}$

Solve for x $f = (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top \mathbf{b}$ ←

In Matlab:

$$f = A \setminus b$$

Note: You almost never want to compute the inverse of a matrix.

Discrete Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$A f = b$$

What is the size of this matrix?

WARNING: requires special treatment at the borders
(target boundary values are same as source)

Discrete Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$Af = b$$

Matrix is $P \times P \rightarrow$ billions of entries

WARNING: requires special treatment at the borders
(target boundary values are same as source)

Integration procedures

- Poisson solver (i.e., least squares integration)
 - + Generally applicable.
 - Matrices A can become very large.
- Acceleration techniques:
 - + (Conjugate) gradient descent solvers.
 - + Multi-grid approaches.
 - + Pre-conditioning.
 - ...
- Alternative solvers: projection procedures.
 - We will discuss one of these when we cover photometric stereo.

A more efficient Poisson solver

Let's look again at our optimization problem

Variational problem

$$\min_f \iint_{\Omega} |\nabla f - \mathbf{v}|^2 \quad \text{with} \quad f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

gradient of f looks
like vector field \mathbf{v}

f is equivalent to f^*
at the boundaries

Input vector field:

$$\mathbf{v} = (u, v)$$

Recall ...

Nabla operator definition

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

Let's look again at our optimization problem

Variational problem

$$\min_f \iint_{\Omega} |\nabla f - \mathbf{v}|^2 \quad \text{with} \quad f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

gradient of f looks

partial-y derivative filter

1
-1

Approach 1: Compute stationary points

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = ?$$

Approach 1: Compute stationary points

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v$$

... and we do what with it?

Approach 1: Compute stationary points

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v$$

... and we set that to zero:

$$\frac{\partial E}{\partial f} = 0 \Rightarrow \underbrace{G^T G}_{} f = \underbrace{G^T}_{} v$$

What is this vector?

What is this matrix?

Approach 1: Compute stationary points

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v$$

... and we set that to zero:

$$\frac{\partial E}{\partial f} = 0 \Rightarrow \underbrace{G^T Gf}_{\text{Laplacian matrix } A} = \underbrace{G^T v}_{\text{vector } b}$$

It is equal to the vector b we derived previously!

It is equal to the Laplacian matrix A we derived previously!

Reminder from variational case

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$Af = b$$

Same system as:

$$G^T Gf = G^T v$$

We arrive at the same system, no matter whether we discretize the continuous Poisson equation or the variational optimization problem.

Approach 1: Compute stationary points

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v$$

... and we set that to zero:

$$\frac{\partial E}{\partial f} = 0 \Rightarrow G^T Gf = G^T v$$

Solving this is exactly as expensive as what we had before.

Approach 2: Use gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v = Af - b \equiv -r$$

We call this term
the residual

Approach 2: Use gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

... we compute its derivative:

$$\frac{\partial E}{\partial f} = G^T Gf - G^T v = Af - b \equiv -r$$

We call this term
the residual

... and then we iteratively compute a solution:

$$f^{i+1} = f^i + \eta^i r^i \quad \text{for } i = 0, 1, \dots, N, \text{ where}$$

η^i are positive step sizes

Selecting optimal step sizes

Make derivative of loss function with respect to η^i equal to zero:

$$E(f) = \|Gf - v\|^2$$

$$E(f^{i+1}) = \|G(f^i + \eta^i r^i) - v\|^2$$

Selecting optimal step sizes

Make derivative of loss function with respect to η^i equal to zero:

$$E(f) = \|Gf - v\|^2$$

$$E(f^{i+1}) = \|G(f^i + \eta^i r^i) - v\|^2$$

$$\frac{\partial E(f^{i+1})}{\partial \eta^i} = [b - A(f^i + \eta^i r^i)]^T r^i = 0 \Rightarrow \eta^i = \frac{(r^i)^T r^i}{(r^i)^T A r^i}$$

Gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

Minimize by iteratively computing:

$$r^i = b - Af^i, \quad \eta^i = \frac{(r^i)^T r^i}{(r^i)^T Ar^i}, \quad f^{i+1} = f^i + \eta^i r^i, \quad i = 0, \dots, N$$

Is this cheaper than the pseudo-inverse approach?

Gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

Minimize by iteratively computing:

$$r^i = b - Af^i, \quad \eta^i = \frac{(r^i)^T r^i}{(r^i)^T Ar^i}, \quad f^{i+1} = f^i + \eta^i r^i, \quad i = 0, \dots, N$$

Is this cheaper than the pseudo-inverse approach?

- We never need to compute A , only its products with vectors f , r .

Gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

Minimize by iteratively computing:

$$r^i = b - Af^i, \quad \eta^i = \frac{(r^i)^T r^i}{(r^i)^T Ar^i}, \quad f^{i+1} = f^i + \eta^i r^i, \quad i = 0, \dots, N$$

Is this cheaper than the pseudo-inverse approach?

- We never need to compute A , only its products with vectors f , r .
- Vectors f , r are images.

Gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

Minimize by iteratively computing:

$$r^i = b - Af^i, \quad \eta^i = \frac{(r^i)^T r^i}{(r^i)^T Ar^i}, \quad f^{i+1} = f^i + \eta^i r^i, \quad i = 0, \dots, N$$

Is this cheaper than the pseudo-inverse approach?

- We never need to compute A , only its products with vectors f , r .
- Vectors f , r are images.
- Because A is the Laplacian matrix, these matrix-vector products can be efficiently computed using convolutions with the Laplacian kernel.

In practice: conjugate gradient descent

Given the loss function:

$$E(f) = \|Gf - v\|^2$$

Minimize by iteratively computing:

$$d^i = r^i + \beta^i d^i, \quad \eta^i = \frac{(r^i)^T r^i}{(d^i)^T Ad^i}, \quad f^{i+1} = f^i + \eta^i d^i, \quad i = 0, \dots, N$$

$$r^{i+1} = r^i - \eta^i Ad^i, \quad \beta^i = \frac{(r^{i+1})^T r^{i+1}}{(r^i)^T r^i}$$

- Smarter way for selecting update directions
- Everything can still be done using convolutions
- Only one convolution needed per iteration

Note: initialization

Does the initialization f^0 matter?

Note: initialization

Does the initialization f^0 matter?

- It doesn't matter in terms of what final f we converge to, because the loss function is convex.

$$E(f) = \|Gf - v\|^2$$

Note: initialization

Does the initialization f^0 matter?

- It doesn't matter in terms of what final f we converge to, because the loss function is convex.

$$E(f) = \|Gf - v\|^2$$

- It does matter in terms of convergence speed.
- We can use a multi-resolution approach:
 - Solve an initial problem for a very low-resolution f (e.g., 2x2).
 - Use the solution to initialize gradient descent for a higher resolution f (e.g., 4x4).
 - Use the solution to initialize gradient descent for a higher resolution f (e.g., 8x8).
 - ...
 - Use the solution to initialize gradient descent for an f with the original resolution $P \times P$.
- Multi-grid algorithms alternative between higher and lower resolutions during the (conjugate) gradient descent iterative procedure.

Reminder from variational case

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$Af = b$$

Remember that what we are doing is equivalent to solving this linear system.

Note: preconditioning

We are solving this linear system:

$$Af = b$$

For any invertible matrix P , this is equivalent to solving:

$$P^{-1}Af = P^{-1}b$$

When is it preferable to solve this alternative linear system?

Note: preconditioning

We are solving this linear system:

$$Af = b$$

For any invertible matrix P , this is equivalent to solving:

$$P^{-1}Af = P^{-1}b$$

When is it preferable to solve this alternative linear system?

- Ideally: If A is invertible, and P is the same as A , the linear system becomes trivial! But computing the inverse of A is even more expensive than solving the original linear system.
- In practice: If the matrix $P^{-1}A$ has a better condition number, or its singular values are more uniformly distributed, the linear system becomes more numerically stable.

What preconditioner P should we use?

Note: preconditioning

We are solving this linear system:

$$Af = b$$

For any invertible matrix P , this is equivalent to solving:

$$P^{-1}Af = P^{-1}b$$

When is it preferable to solve this alternative linear system?

- Ideally: If A is invertible, and P is the same as A , the linear system becomes trivial! But computing the inverse of A is even more expensive than solving the original linear system.
- In practice: If the matrix $P^{-1}A$ has a better condition number, or its singular values are more uniformly distributed, the linear system becomes more numerically stable.

What preconditioner P should we use?

- Standard preconditioners like Jacobi.
- More effective preconditioners. Active area of research.

$$P_{\text{Jacobi}} = \text{diag}(A)$$

Note: preconditioning

We are solving this linear system:

$$Af = b$$

For any invertible matrix P , this is equivalent to solving:

$$P^{-1}Af = P^{-1}b$$

Preconditioning can be incorporated in the conjugate gradient descent algorithm.

When is it preferable to solve this alternative linear system?

- Ideally: If A is invertible, and P is the same as A , the linear system becomes trivial! But computing the inverse of A is even more expensive than solving the original linear system.
- In practice: If the matrix $P^{-1}A$ has a better condition number, or its singular values are more uniformly distributed, the linear system becomes more numerically stable.

What preconditioner P should we use?

- Standard preconditioners like Jacobi.
- More effective preconditioners. Active area of research.

Is this effective for Poisson solvers?

$$P_{\text{Jacobi}} = \text{diag}(A)$$

Discrete Poisson equation

Poisson equation (with Dirichlet boundary conditions)

$$\Delta f = \operatorname{div} \mathbf{v} \quad \text{over } \Omega, \quad \text{with } f|_{\partial\Omega} = f^*|_{\partial\Omega}$$

After discretization, equivalent to:

$$\begin{bmatrix} D & I & 0 & 0 & 0 & \dots & 0 \\ I & D & I & 0 & 0 & \dots & 0 \\ 0 & I & D & I & 0 & \dots & 0 \\ \vdots & \ddots & \ddots & \ddots & \ddots & \ddots & \vdots \\ 0 & \dots & 0 & I & D & I & 0 \\ 0 & \dots & \dots & 0 & I & D & I \\ 0 & \dots & \dots & \dots & 0 & I & D \end{bmatrix} \cdot \begin{bmatrix} f_1 \\ \vdots \\ f_{q_1} \\ \vdots \\ f_{q_2} \\ \vdots \\ f_p \\ \vdots \\ f_{q_3} \\ \vdots \\ f_{q_4} \\ \vdots \\ f_p \end{bmatrix} = \begin{bmatrix} (\nabla \cdot \mathbf{v})_1 \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_1} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_2} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_3} \\ \vdots \\ (\nabla \cdot \mathbf{v})_{q_4} \\ \vdots \\ (\nabla \cdot \mathbf{v})_p \end{bmatrix}$$

Linear system of equations:

$$Af = b$$

Matrix is $P \times P \rightarrow$ billions of entries

WARNING: requires special treatment at the borders
(target boundary values are same as source)

Note: handling (Dirichlet) boundary conditions

- Form a mask B that is 0 for pixels that should not be updated (pixels on $S-\Omega$ and $\partial\Omega$) and 1 otherwise.
- Use convolution to perform Laplacian filtering over the entire image.
- Use (conjugate) gradient descent rules to only update pixels for which the mask is 1. Equivalently, change the update rules to:

$$f^{i+1} = f^i + B\eta^i r^i \quad (\text{gradient descent})$$

$$f^{i+1} = f^i + B\eta^i d^i \quad (\text{conjugate gradient descent})$$

Note: handling (Dirichlet) boundary conditions

- Form a mask B that is 0 for pixels that should not be updated (pixels on $S-\Omega$ and $\partial\Omega$) and 1 otherwise.
- Use convolution to perform Laplacian filtering over the entire image.
- Use (conjugate) gradient descent rules to only update pixels for which the mask is 1. Equivalently, change the update rules to:

In practice, masking is also required at other steps of (conjugate) gradient descent, to deal with invalid boundaries (e.g., from convolutions).

$$f^{i+1} = f^i + B\eta^i r^i \quad (\text{gradient descent})$$

$$f^{i+1} = f^i + B\eta^i d^i \quad (\text{conjugate gradient descent})$$

Poisson image editing examples

Photoshop's "healing brush"

- Slightly more advanced version of what we covered here:
- Uses higher-order derivatives

Contrast problem

Loss of contrast when pasting from dark to bright:

- Contrast is a multiplicative property.
- With Poisson blending we are matching linear differences.

Contrast problem

Loss of contrast when pasting from dark to bright:

- Contrast is a multiplicative property.
- With Poisson blending we are matching linear differences.

Solution: Do blending in log-domain.

Reflection Layer

Idea: look at how gradients are affected

Same gradient vector direction

No reflections

Idea: look at how gradients are affected

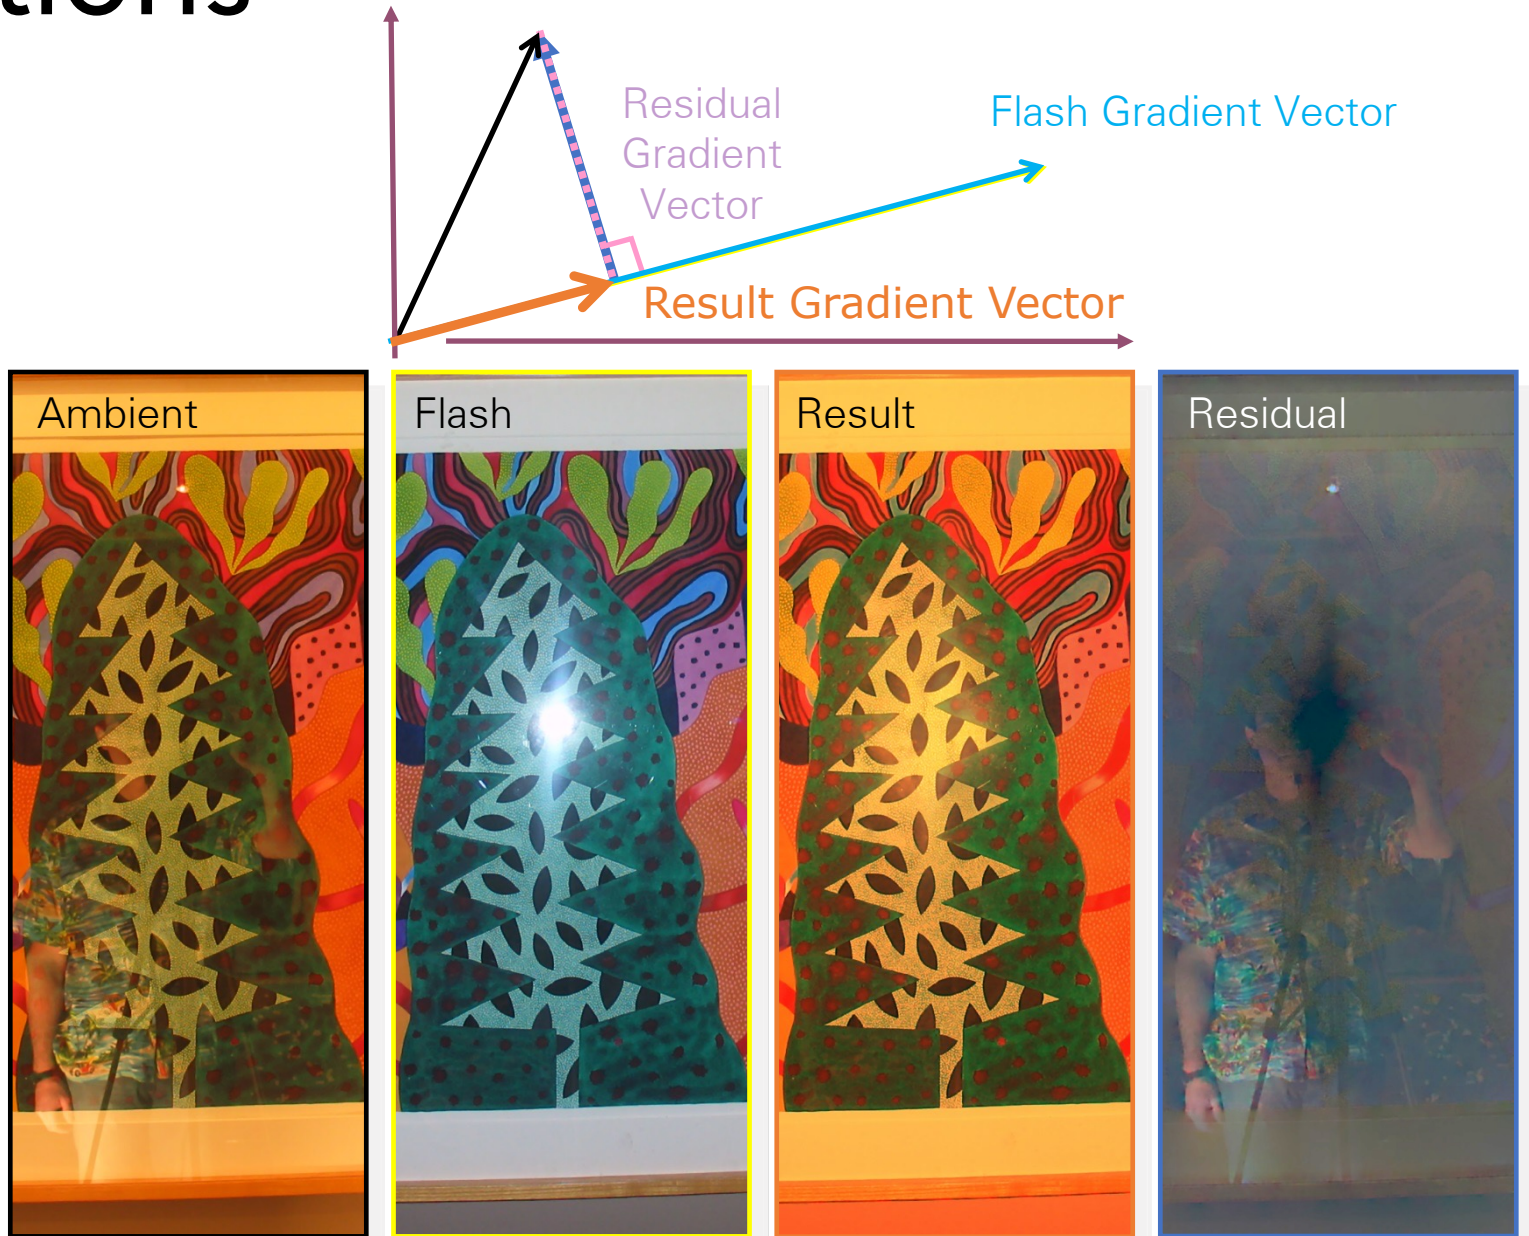

Different gradient vector direction

With reflections

Gradient projections

- Image gradients in flash and ambient images should be aligned.
- Ambient gradient direction is refined by projecting onto the flash gradient.
- "Result" image is formed by 2D integration of the refined gradient.
- Residual gradients after projection create the "reflection layer".
- Gradient projection splits an image into reflection-free and reflection layers.

Why projections?

- Projection ensures the gradient direction is preserved, even with a new magnitude.
- Orthogonal gradients holds minimal visual information.
- Rotating gradients by 90° yields zero divergence.
- 90° rotation results in no image detail.
- 180° rotation creates a negative image.

- × Illumination Edge

Removing Reflections due to Flash

Removing Flash Hotspot

Weights W_s

and ambient image
and Gradient Coherency

Depth Compensation

Scale flash gradients using the ratio of flash and ambient images

$$\frac{Flash}{Ambient} = \frac{\rho \cos \theta}{(Ambient^*) \times distance^2} \propto \frac{1}{distance^2}$$

Limitations

- Difficult Scenarios
 - Dynamic scenes
 - Co-located artifacts
 - Strong ambient illumination edges
- Issues
 - Lack of reliable gradients
 - Homogeneous or dark regions
 - Color coherency

Gradient-domain rendering

Rendering Equation

Rendering Equation

$$I_j = \int_{\Omega} f_j(\bar{x}) d\mu(\bar{x})$$

Rendering Equation

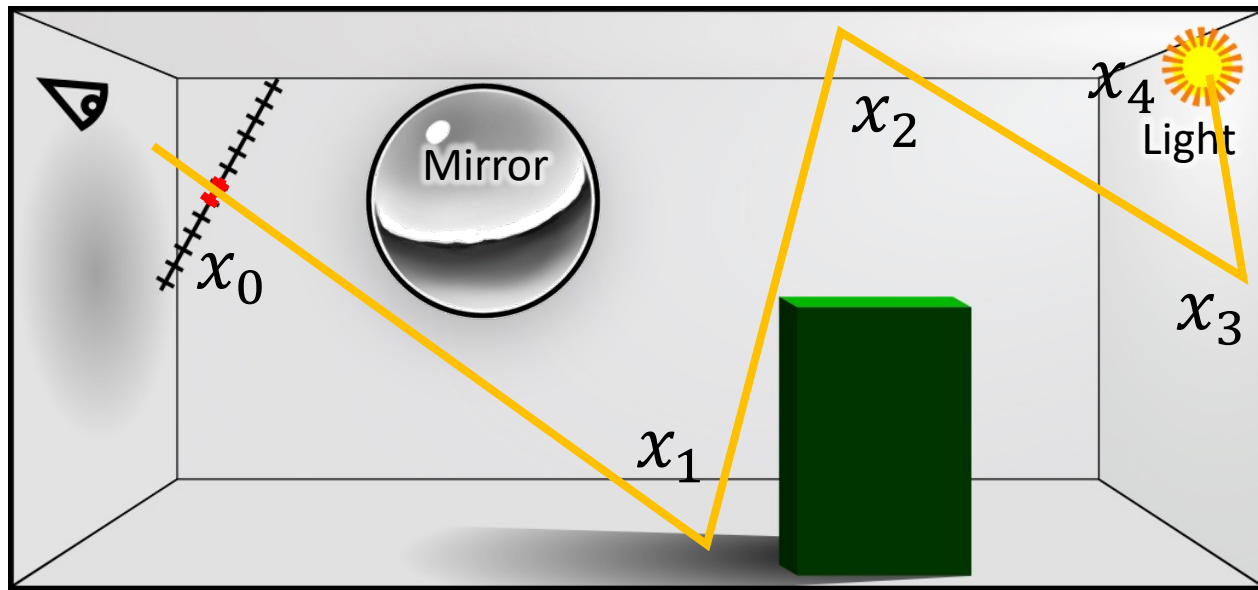

$$I_j = \int_{\Omega} f_j(\bar{x}) d\mu(\bar{x})$$

Rendering Equation

$$I_j = \int_{\Omega} f_j(\bar{x}) d\mu(\bar{x})$$

Rendering Equation

$$\bar{x} = x_0 x_1 x_2 x_3 x_4$$

$$I_j = \int_{\Omega} f_j(\bar{x}) d\mu(\bar{x})$$

$f_j(\bar{x}) =$ (Materials) x (Geometries)
x Emitted Lum. x Pixel filtering

Rendering Equation

$$I_j = \int_{\Omega} f_j(\bar{x}) d\mu(\bar{x})$$

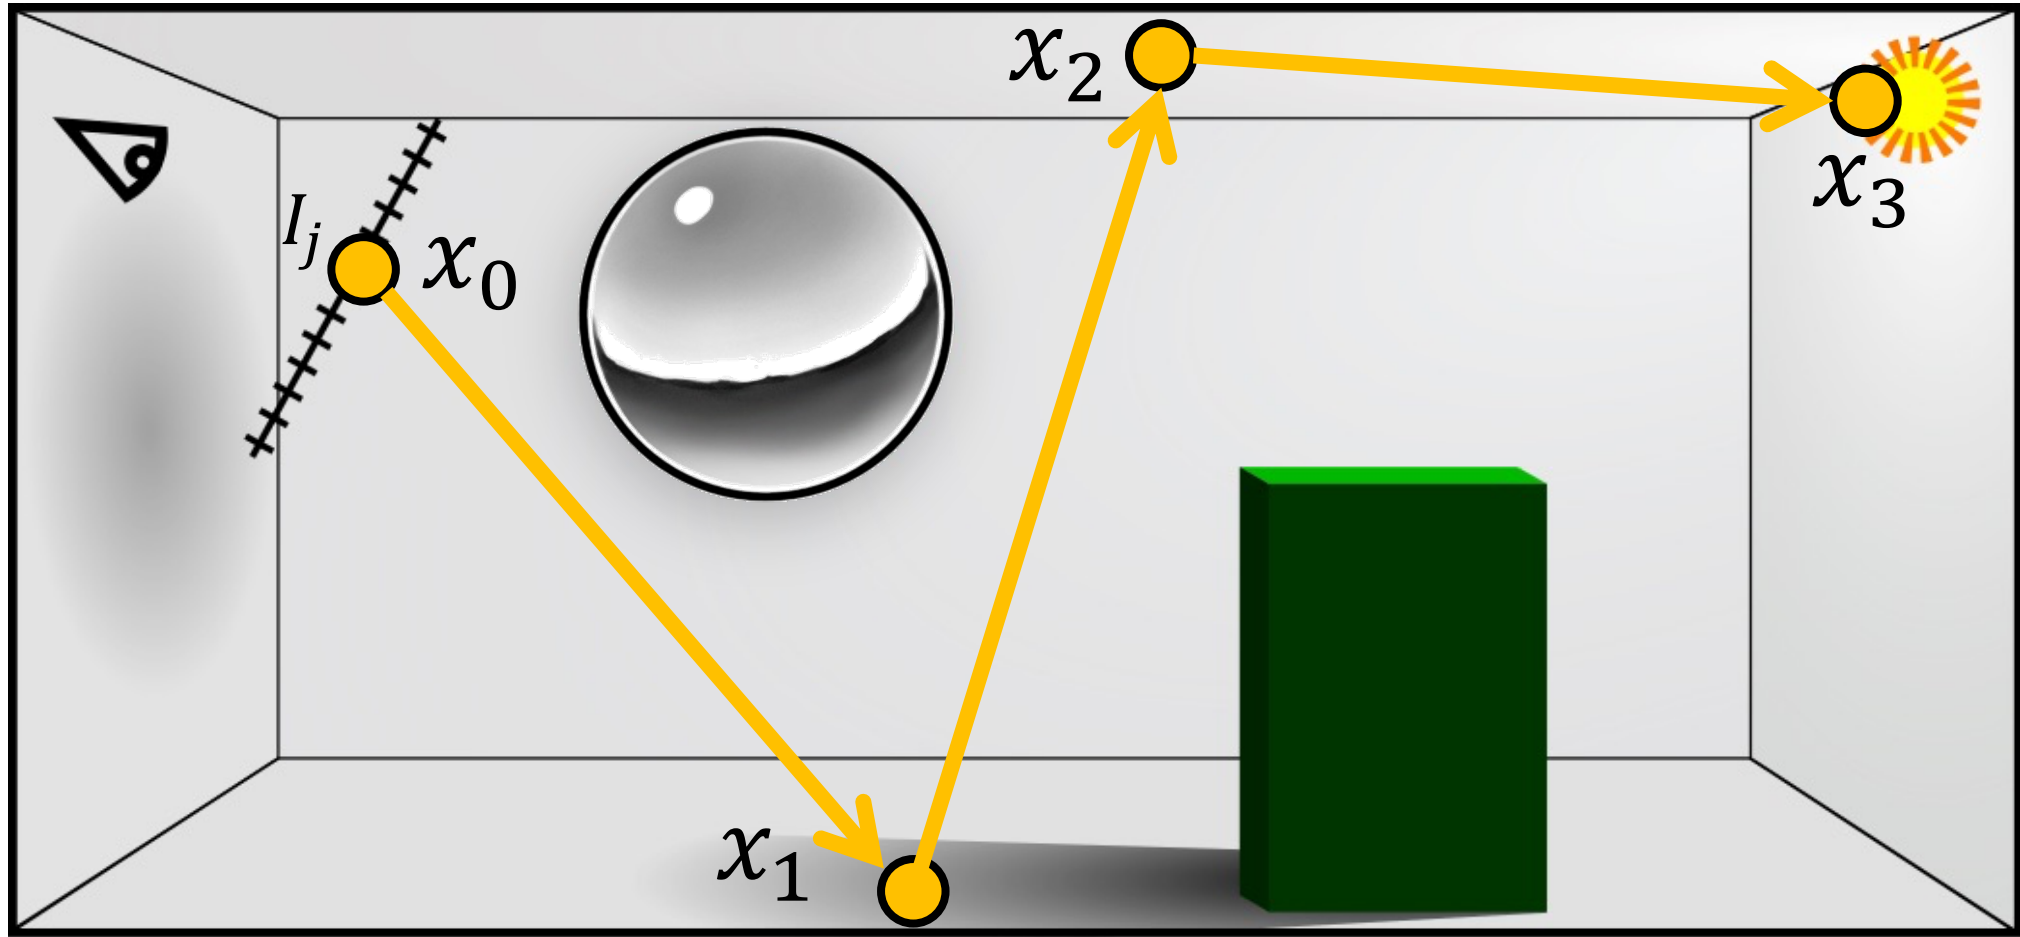

Monte Carlo estimator

$$I_j \approx \frac{1}{N} \sum_{k=1}^N \frac{f_j(\bar{x}_k)}{p(\bar{x}_k)}$$

$p(\bar{x}_k)$ is the probability density to sample \bar{x}_k

Path Tracing

Motivation

$$\text{error} / 2 = \text{samples} * 4$$

15min

30min

45min

1h

Motivation

Observation

- Noise mostly proportional to signal magnitude

Idea

- Noise reduction by sampling **sparse** signal representation
 - Sparse: signal magnitude low, except in small regions
 - Wavelets, edge filters, **gradients**, etc.
 - Theoretical justification: Kettunen et al. SIGGRAPH 2015

The Basic Algorithm

1. Perform standard Monte Carlo rendering to obtain primal image
2. Sample gradients: horizontal and vertical
3. Reconstruct image from primal and gradients

Image Reconstruction

Reconstructed image

Fusing **gradients** and **primal** information inside one image

Primal domain

Gradient domain

Primal domain

gradients of natural images are sparse (close to zero in most places)

Gradient domain

Can I go from one image to the other?

Can I go from one image to the other?

differentiation (e.g., convolution with forward-difference kernel)

integration (e.g., Poisson solver)

Rendering

Primal-domain rendering: simulate intensities directly

Gradient-domain rendering: simulate gradients, then solve Poisson problem

Why would gradient-domain rendering make sense?

Rendering

Primal-domain rendering: simulate intensities directly

Gradient-domain rendering: simulate gradients, then solve Poisson problem

Why would gradient-domain rendering make sense?

- Since gradients are sparse, I can focus most (but not all of) my resources (i.e., ray samples) on rendering the few pixels that are non-zero in gradient space, with much lower variance.
- Poisson reconstruction performs a form of “filtering” to further reduce variance.

Rendering

Primal-domain rendering: simulate intensities directly

Gradient-domain rendering: simulate gradients, then solve Poisson problem

Why would gradient-domain rendering make sense? Why not all?

- Since gradients are sparse, I can focus most (but not all of) my resources (i.e., ray samples) on rendering the few pixels that are non-zero in gradient space, with much lower variance.
- Poisson reconstruction performs a form of “filtering” to further reduce variance.

Rendering

Primal-domain rendering: simulate intensities directly

Gradient-domain rendering: simulate gradients, then solve Poisson problem

You still need to render a few sparse pixels (roughly one per “flat” region in the image) in primal domain, to use as boundary conditions in the Poisson solver.

- In practice, do image-space stratified sampling to select these pixels.

Gradient-Domain Rendering

Gradient-Domain Metropolis Light Transport

Jaakko Lehtinen^{1,2} Tero Karras¹ Samuli Laine¹ Miika Aittala^{2,1} Frédo Durand³ Timo Aila¹

¹NVIDIA Research ²Aalto University ³MIT CSAIL

Figure 1: We compute image gradients I^{dx} , I^{dy} and a coarse image I^g using a novel Metropolis algorithm that distributes samples according to path space gradients, resulting in a distribution that mostly follows image edges. The final image is reconstructed using a Poisson solver.

Gradient-Domain Path Tracing

Markus Kettunen¹ Marco Manzi² Miika Aittala¹ Jaakko Lehtinen^{1,3} Frédo Durand⁴ Matthias Zwicker²

¹Aalto University ²University of Bern ³NVIDIA ⁴MIT CSAIL

Figure 1: Comparing gradient-domain path tracing (G-PT, L_1 reconstruction) to path tracing at equal rendering time (2 hours). In this time, G-PT draws about 2,000 samples per pixel and the path tracer about 5,000. G-PT consistently outperforms path tracing, with the rare exception of some highly specular objects. Our frequency analysis explains why G-PT outperforms conventional path tracing.

A lot of papers since SIGGRAPH 2013 (first introduction of gradient-domain rendering) that are looking to extend basically all primal-domain rendering algorithms to the gradient domain.

Does it help?

Gradient-domain path tracing (2 minutes)

Primal-domain path tracing (2 minutes)

Remember this idea (we'll come back to it)

Why would you want a gradient camera?

- Much faster frame rate, as you only read out very few pixels (where gradient is significant).
- Much higher dynamic range, if also combined with logarithmic gradients.

Can you directly display the measurements of such a camera?

- You need to use a Poisson solver to reconstruct the image from the measured gradients.

How would you build a gradient camera?

Change the sensor

Can you think how?

Change the sensor

Change the sensor

Any disadvantages of this sensor?

Why is this better than computing gradients in post-processing?

What about Poisson noise?

Change the sensor

Any disadvantages of this sensor?

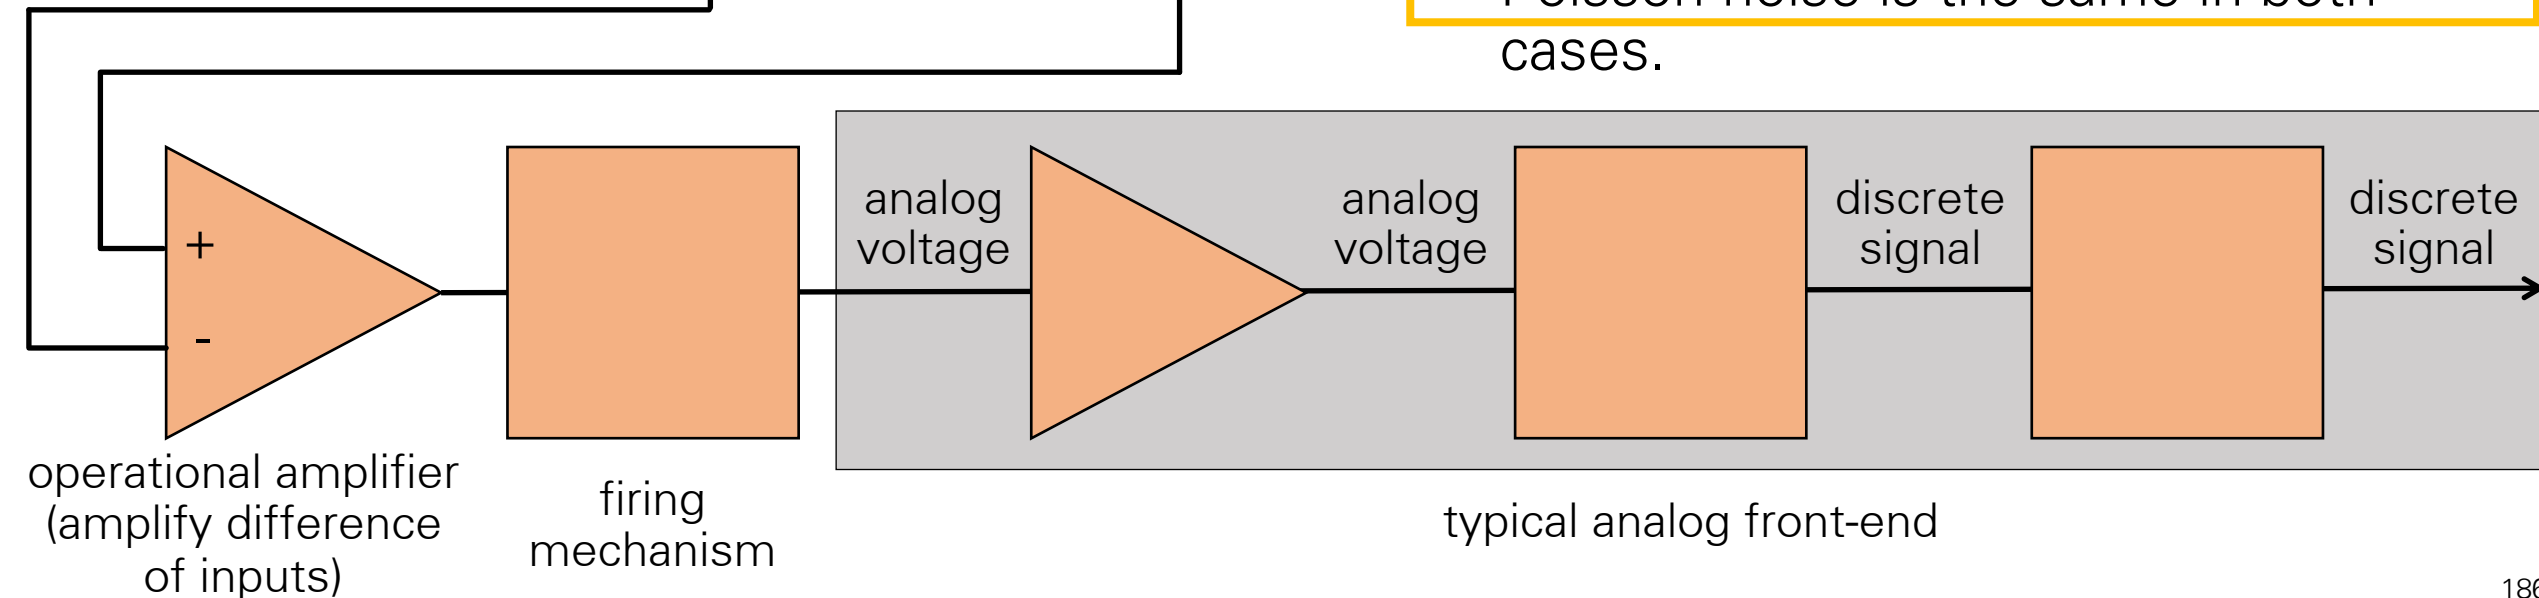

- Spatial resolution is reduced by 2x.
- Photosensitive area is reduced.

Why is this better than computing gradients in post-processing?

- Additive noise is reduced.
- Acquisition is faster thanks to the firing mechanism and sparsity of edges.

What about Poisson noise?

- Poisson noise is the same in both cases.

Open Challenges in Computer Vision

- The past 60 years of research have been devoted to frame-based cameras.

...but they are not good enough!

Latency & Motion blur

Dynamic Range

- Event cameras do not suffer from these problems!

What is an event camera?

- Novel sensor that measures only **motion in the scene**
- **First commercialized in 2008** by T. Delbruck (UZHÐ) under the name of Dynamic Vision Sensor (DVS)
- **Low-latency** ($\sim 1 \mu\text{s}$)
- **No motion blur**
- **High dynamic range** (140 dB instead of 60 dB)
- **Ultra-low power** (mean: 1mW vs 1W)

Traditional vision algorithms cannot be used because:

- **Asynchronous pixels**
- **No intensity information** (only binary intensity changes)

standard camera output:

event camera output:

Image of the solar eclipse captured by a DVS

Camera vs Event Camera

- A traditional camera outputs frames at fixed time intervals:

- By contrast, a **DVS** outputs **asynchronous events** at **microsecond resolution**. An event is generated each time a single pixel detects an intensity changes value

Generative Event Model

Consider the intensity at a single pixel...

$$\pm C = \log I(\mathbf{x}, t) - \log I(\mathbf{x}, t - \Delta t)$$

Events are triggered **asynchronously**

Event cameras are inspired by the Human Eye

Human retina:

- 130 million photoreceptors
- But only 2 million axons!

Event Camera Output with No Motion

Standard Camera

Event Camera (ON, OFF events)

$\Delta T = 40 \text{ ms}$

Without motion, only background noise is output

Event Camera Output with Relative Motion

Standard Camera

Event Camera (ON, OFF events)

$\Delta T = 10 \text{ ms}$

Event Camera Output with Relative Motion

What if we combined the complementary advantages of event and standard cameras?

Why combining them?

< 10 years research

Event Camera

> 60 years of research!

Standard Camera

Update rate	High (asynchronous): 1 MHz	Low (synchronous)
Dynamic Range	High (140 dB)	Low (60 dB)
Motion Blur	No	Yes
Static motion	No (event camera is a high pass filter)	Yes
Absolute intensity	No (reconstructable up to a constant)	Yes

DAVIS sensor: Events + Images + IMU

- Combines an event and a standard camera in the same pixel array (→ the same pixel can both trigger events and integrate light intensity).
- It also has an IMU

Spatio-temporal visualization of the output of a DAVIS sensor

Temporal aggregation of events overlaid on a DAVIS frame

Deblurring a blurry video

- A **blurry image** can be regarded as the **integral of a sequence of latent images** during the exposure time, while the **events** indicate the **changes between the latent images**.
- **Finding:** sharp image obtained by subtracting the double integral of event from input image

$$\log \left[\text{Input blur image} \right] - \iint \left[\text{Input events} \right] = \log \left[\text{Output sharp image} \right]$$

Input blur image Input events Output sharp image

Video Frame Interpolation

- Video frame interpolation methods aims at **generating intermediate frames by inferring object motions** in the image from **consecutive keyframes**.
- Motion is generally modelled with first-order approximations like **optical flow**.
 - This choice restricts the types of motions, leading to errors in highly dynamic scenarios.
- **Event cameras** provides **auxiliary visual information** in the blind-time **between frames**.
