Questions about computation

Q. What is a general-purpose computer?
Q. Are there limits on the power of digital computers?
Q. Are there limits on the power of machines we can build?

David Hilbert   Kurt Gödel   Alan Turing   Alonzo Church   John von Neumann

---

A simple model of computation: DFAs

Tape.
• Stores input.
• One arbitrarily long strip, divided into cells.
• Finite alphabet of symbols.

Tape head.
• Points to one cell of tape.
• Reads a symbol from active cell.
• Moves one cell at a time.

Q. Is there a more powerful model of computation?
A. Yes.

A universal model of computation: Turing machines

Tape.
- Stores input, output, and intermediate results.
- One arbitrarily long strip, divided into cells.
- Finite alphabet of symbols.

Tape head.
- Points to one cell of tape.
- Reads a symbol from active cell.
- Writes a symbol to active cell.
- Moves one cell at a time.

tape head
↓

| tape | … | # | 1 | 1 | **0** | 0 | + | 1 | 0 | 1 | 1 | # | … |

Q. Is there a more powerful model of computation?
A. No! ← most important scientific result of 20th century?

Church-Turing thesis (1936)

> **Turing machines can compute any function that can be computed by a physically harnessable process of the natural world.**

Remark. "Thesis" and not a mathematical theorem because it's a statement about the physical world and not subject to proof.

Use simulation to prove models equivalent.
- Android simulator on iPhone.
- iPhone simulator on Android.

Implications.
- No need to seek more powerful machines or languages.
- Enables rigorous study of computation (in this universe).

Bottom line. Turing machine is a simple and universal model of computation.

Church-Turing thesis: evidence

- 8 decades without a counterexample.
- Many, many models of computation that turned out to be equivalent. ← "universal"

model of computation	description
enhanced Turing machines	multiple heads, multiple tapes, 2D tape, nondeterminism
untyped lambda calculus	method to define and manipulate functions
recursive functions	functions dealing with computation on integers
unrestricted grammars	iterative string replacement rules used by linguists
extended L-systems	parallel string replacement rules that model plant growth
programming languages	Java, C, C++, Perl, Python, PHP, Lisp, PostScript, Excel
random access machines	registers plus main memory, e.g., TOY, Pentium
cellular automata	cells which change state based on local interactions
quantum computer	compute using superposition of quantum states
DNA computer	compute using biological operations on DNA

A question about algorithms

Q. Which algorithms are useful in practice?
- Measure running time as a function of input size N.
- Useful in practice ("efficient") = polynomial time for all inputs. ← $a N^b$

| von Neumann (1953) | Nash (1955) | Gödel (1956) | Cobham (1964) | Edmonds (1965) | Rabin (1966) |

Ex 1. Sorting N items takes $N \log N$ compares using mergesort.
Ex 2. Finding best TSP tour on N points takes $N!$ steps using brute search.

Theory. Definition is broad and robust. ← constants a and b tend to be small, e.g., $3 N^2$
Practice. Poly-time algorithms scale to huge problems.

Exponential growth

Exponential growth dwarfs technological change.
- Suppose you have a giant parallel computing device…
- With as many processors as electrons in the universe…
- And each processor has power of today's supercomputers…
- And each processor works for the life of the universe…

quantity	value
electrons in universe [†]	10^{79}
supercomputer instructions per second [†]	10^{13}
age of universe in seconds [†]	10^{17}

[†] estimated

- Will not help solve 1,000 city TSP problem via brute force.

$1000! \gg 10^{1000} \gg 10^{79} \times 10^{13} \times 10^{17}$

$(30, 2^{30})$

$(20, 2^{20})$
Questions about problems

Q. Which problems can we solve in practice?
A. Those with poly-time algorithms.

Q. Which problems have poly-time algorithms?
A. Not so easy to know. Focus of today's lecture.

result

input

many known poly-time algorithms for sorting

no known poly-time algorithm for TSP

Bird's-eye view

Def. A problem is intractable if it can't be solved in polynomial time.
Desiderata. Prove that a problem is intractable.

input size = c + lg K

Two problems that provably require exponential time.
- Given a constant-size program, does it halt in at most K steps?
- Given N-by-N checkers board position, can the first player force a win?

using forced capture rule

HALT!

Alan designed the perfect computer

Frustrating news. Very few successes.

INTRACTABILITY

‣ **Search problems**
‣ P vs. NP
‣ Classifying problems
‣ NP-completeness

Four fundamental problems

·LSOLVE. Given a system of linear equations, find a solution.

$$
\begin{aligned}
0x_0 &+ 1x_1 &+ 1x_2 &= 4 \\
2x_0 &+ 4x_1 &- 2x_2 &= 2 \\
0x_0 &+ 3x_1 &+ 15x_2 &= 36
\end{aligned}
$$

$$
\begin{aligned}
x_0 &= -1 \\
x_1 &= 2 \\
x_2 &= 2
\end{aligned}
$$

← variables are real numbers

·LP. Given a system of linear inequalities, find a solution.

$$
\begin{aligned}
48x_0 &+ 16x_1 &+ 119x_2 &\le 88 \\
5x_0 &+ 4x_1 &+ 35x_2 &\ge 13 \\
15x_0 &+ 4x_1 &+ 20x_2 &\ge 23 \\
x_0 &, \ x_1 &, \ x_2 &\ge 0
\end{aligned}
$$

$$
\begin{aligned}
x_0 &= 1 \\
x_1 &= 1 \\
x_2 &= \tfrac{1}{5}
\end{aligned}
$$

← variables are real numbers

·ILP. Given a system of linear inequalities, find a 0-1 solution.

$$
\begin{aligned}
x_1 &+ x_2 &\ge 1 \\
x_0 \quad &+ x_2 &\ge 1 \\
x_0 + x_1 &+ x_2 &\le 2
\end{aligned}
$$

$$
\begin{aligned}
x_0 &= 0 \\
x_1 &= 1 \\
x_2 &= 1
\end{aligned}
$$

← variables are 0 or 1

·SAT. Given a system of boolean equations, find a binary solution.

$$
\begin{aligned}
(x'_1 \ or \ x'_2) \ and \ (x_0 \ or \ x_2) &= true \\
(x_0 \ or \ x_1) \ and \ (x_1 \ or \ x'_2) &= false \\
(x_0 \ or \ x_2) \ and \quad (x'_0) \quad &= true
\end{aligned}
$$

$$
\begin{aligned}
x_0 &= false \\
x_1 &= false \\
x_2 &= true
\end{aligned}
$$

← variables are true or false

13

Four fundamental problems

LSOLVE. Given a system of linear equations, find a solution.

LP. Given a system of linear inequalities, find a solution.

ILP. Given a system of linear inequalities, find a 0-1 solution.

SAT. Given a system of boolean equations, find a binary solution.

Q. Which of these problems have poly-time algorithms?

• LSOLVE. Yes. Gaussian elimination solves N-by-N system in N^3 time.

• LP. Yes. Ellipsoid algorithm is poly-time. ← but was open problem for decades

• ILP, SAT. No poly-time algorithm known or believed to exist!

↖ but we still don't know for sure

14

Search problems

Search problem. Given an instance I of a problem, find a solution S.

Requirement. Must be able to efficiently check that S is a solution.

poly-time in size of instance I

or report none exists

15

Search problems

LSOLVE. Given a system of linear equations, find a solution.

$$
\begin{aligned}
0x_0 &+ 1x_1 &+ 1x_2 &= 4 \\
2x_0 &+ 4x_1 &- 2x_2 &= 2 \\
0x_0 &+ 3x_1 &+ 15x_2 &= 36
\end{aligned}
$$

$$
\begin{aligned}
x_0 &= -1 \\
x_1 &= 2 \\
x_2 &= 2
\end{aligned}
$$

instance I

solution S

To check solution S, plug in values and verify each equation.

16

Search problems

Search problem. Given an instance I of a problem, find a solution S.
Requirement. Must be able to efficiently check that S is a solution.

LP. Given a system of linear inequalities, find a solution.

$$
\begin{array}{rrrrr}
48x_0 & +16x_1 & +119x_2 & \leq & 88 \\
5x_0 & +4x_1 & +35x_2 & \geq & 13 \\
15x_0 & +4x_1 & +20x_2 & \geq & 23 \\
x_0 & , \quad x_1 & , \quad x_2 & \geq & 0
\end{array}
$$

$$
\begin{array}{rcl}
x_0 & = & 1 \\
x_1 & = & 1 \\
x_2 & = & \frac{1}{5}
\end{array}
$$

instance I   **solution S**

To check solution S, plug in values and verify each inequality.

Search problems

Search problem. Given an instance I of a problem, find a solution S.
Requirement. Must be able to efficiently check that S is a solution.

ILP. Given a system of linear inequalities, find a binary solution.

$$
\begin{array}{rrrrr}
 & x_1 & + x_2 & \geq & 1 \\
x_0 & & + x_2 & \geq & 1 \\
x_0 & + x_1 & + x_2 & \leq & 2
\end{array}
$$

$$
\begin{array}{rcl}
x_0 & = & 0 \\
x_1 & = & 1 \\
x_2 & = & 1
\end{array}
$$

instance I   **solution S**

To check solution S, plug in values and verify each inequality.

Search problems

Search problem. Given an instance I of a problem, find a solution S.
Requirement. Must be able to efficiently check that S is a solution.

SAT. Given a system of boolean equations, find a boolean solution.

$$
\begin{array}{rl}
(x'_1 \ or \ x'_2) \ and \ (x_0 \ or \ x_2) & = true \\
(x_0 \ or \ x_1) \ and \ (x_1 \ or \ x'_2) & = false \\
(x_0 \ or \ x_2) \ and \quad (x'_0) & = true
\end{array}
$$

$$
\begin{array}{l}
x_0 = false \\
x_1 = false \\
x_2 = true
\end{array}
$$

instance I   **solution S**

To check solution S, plug in values and verify each equation.

Search problems

Search problem. Given an instance I of a problem, find a solution S.
Requirement. Must be able to efficiently check that S is a solution.

FACTOR. Given an n-bit integer x, find a nontrivial factor.

input size = number of bits

147573952589676412927   193707721

instance I   **solution S**

To check solution S, long divide 193707721 into 147573952589676412927.

INTRACTABILITY

‣ **Search problems**
‣ **P vs. NP**
‣ **Classifying problems**
‣ **NP-completeness**

NP

Def. NP is the class of all search problems. ← Note: classic definition limits NP to yes-no problems

problem	description	poly-time algorithm	instance I	solution S
LSOLVE (A, b)	Find a vector x that satisfies $Ax = b$	Gaussian elimination	$0x_0 + 1x_1 + 1x_2 = 4$ $2x_0 + 4x_1 - 2x_2 = 2$ $0x_0 + 3x_1 + 15x_2 = 36$	$x_0 = -1$ $x_1 = 2$ $x_2 = 2$
LP (A, b)	Find a vector x that satisfies $Ax \leq b$	ellipsoid	$48x_0 + 16x_1 + 119x_2 \leq 88$ $5x_0 + 4x_1 + 35x_2 \geq 13$ $15x_0 + 4x_1 + 20x_2 \geq 23$ $x_0 , x_1 , x_2 \geq 0$	$x_0 = 1$ $x_1 = 1$ $x_2 = \frac{1}{5}$
ILP (A, b)	Find a binary vector x that satisfies $Ax \leq b$	???	$x_1 + x_2 \geq 1$ $x_0 + x_2 \geq 1$ $x_0 + x_1 + x_2 \leq 2$	$x_0 = 0$ $x_1 = 1$ $x_2 = 1$
SAT (Φ, b)	Find a boolean vector x that satisfies $\Phi(x) = b$	???	$(x'_1 \, or \, x'_2) \; and \; (x_0 \, or \, x_2) = true$ $(x_0 \, or \, x_1) \; and \; (x_1 \, or \, x'_2) = false$ $(x_0 \, or \, x_2) \; and \; (x'_0) = true$	$x_0 = false$ $x_1 = false$ $x_2 = true$
FACTOR (x)	Find a nontrivial factor of the integer x	???	147573952589676412927	193707721

Significance. What scientists and engineers aspire to compute feasibly.

P

Def. P is the class of search problems solvable in poly-time.

← Note: classic definition limits P to yes-no problems

problem	description	poly-time algorithm	instance I	solution S
LSOLVE (A, b)	Find a vector x that satisfies $Ax = b$	Gaussian elimination (Edmonds 1967)	$0x_0 + 1x_1 + 1x_2 = 4$ $2x_0 + 4x_1 - 2x_2 = 2$ $0x_0 + 3x_1 + 15x_2 = 36$	$x_0 = -1$ $x_1 = 2$ $x_2 = 2$
LP (A, b)	Find a vector x that satisfies $Ax \leq b$	ellipsoid (Khachiyan 1979)	$48x_0 + 16x_1 + 119x_2 \leq 88$ $5x_0 + 4x_1 + 35x_2 \geq 13$ $15x_0 + 4x_1 + 20x_2 \geq 23$ $x_0 , x_1 , x_2 \geq 0$	$x_0 = 1$ $x_1 = 1$ $x_2 = \frac{1}{5}$
SORT (a)	Find a permutation that puts array a in order	mergesort (von Neumann 1945)	2.3 8.5 1.2 9.1 2.2 0.3	5 2 4 0 1 3
STCONN (G, s, t)	Find a path in a graph G from s to t	depth-first search (Theseus)		

Significance. What scientists and engineers do compute feasibly.

Nondeterminism

Nondeterministic machine can guess the desired solution.
← recall NFA implementation

Ex. int[] a = new int[N];
• Java: initializes entries to 0.
• Nondeterministic machine: initializes entries to the solution!

ILP. Given a system of linear inequalities, guess a 0-1 solution.

$$x_1 + x_2 \geq 1$$
$$x_0 + x_2 \geq 1$$
$$x_0 + x_1 + x_2 \leq 2$$

$$x_0 = 0$$
$$x_1 = 1$$
$$x_2 = 1$$

Ex. Turing machine.
• Deterministic: state, input determines next state.
• Nondeterministic: more than one possible next state.

0:x → B
A
0:y → C

NP. Search problems solvable in poly time on a nondeterministic TM.
Extended Church-Turing thesis

P = search problems solvable in poly–time in the natural world.

Evidence supporting thesis. True for all physical computers.

Natural computers? No successful attempts (yet).

doesn't work for large N

Ex. Computing Steiner trees with soap bubbles

STEINER: Find set of lines of minimal length connecting N given points

Implication. To make future computers more efficient, suffices to focus on improving implementation of existing designs.

P vs. NP

Does P = NP ?

Automating creativity

Q. Being creative vs. appreciating creativity?

Ex. Mozart composes a piece of music; our neurons appreciate it.
Ex. Wiles proves a deep theorem; a colleague referees it.
Ex. Boeing designs an efficient airfoil; a simulator verifies it.
Ex. Einstein proposes a theory; an experimentalist validates it.

creative
ordinary

Computational analog. Does P = NP?

The central question

P. Class of search problems solvable in poly-time.
NP. Class of all search problems.

Does P = NP ?   [Can you always avoid brute–force searching and do better]

Two worlds.

P ≠ NP

P = NP

If P = NP… Poly-time algorithms for SAT, ILP, TSP, FACTOR, …
If P ≠ NP… Would learn something fundamental about our universe.
Overwhelming consensus. P ≠ NP.

The central question

P. Class of search problems solvable in poly-time.

NP. Class of all search problems.

Does P = NP ?   [Can you always avoid brute–force searching and do better]

Millennium prize. $1 million for resolution of P = NP problem.

‣ Search problems
‣ P vs. NP
‣ **Classifying problems**
‣ NP-completeness

A key problem: satisfiability

SAT. Given a system of boolean equations, find a solution.

$$x'_1 \text{ or } x_2 \text{ or } x_3 = true$$
$$x_1 \text{ or } x'_2 \text{ or } x_3 = true$$
$$x'_1 \text{ or } x'_2 \text{ or } x'_3 = true$$
$$x'_1 \text{ or } x'_2 \text{ or } x_4 = true$$

Key applications.

• Automatic verification systems for software.
• Electronic design automation (EDA) for hardware.
• Mean field diluted spin glass model in physics.
• ...

Exhaustive search

Q. How to solve an instance of SAT with n variables?

A. Exhaustive search: try all 2^n truth assignments.

Q. Can we do anything substantially more clever?

Conjecture. No poly-time algorithm for SAT.
"intractable"

Classifying problems

Q. Which search problems are in P?

A. No easy answers (we don't even know whether P = NP).

Cook reduction

Problem X poly-time reduces to problem Y if X can be solved with:
- Polynomial number of standard computational steps.
- Polynomial number of calls to Y.

instance I
(of X)

Algorithm
for Y

solution S to I

Algorithm for X

Consequence. If SAT poly-time reduces to Y, then we conclude that Y is (probably) intractable.

33

SAT poly-time reduces to ILP

SAT. Given a system of boolean equations, find a solution.

$$x'_1 \ or \ x_2 \ or \ x_3 \ = true$$
$$x_1 \ or \ x'_2 \ or \ x_3 \ = true$$
$$x'_1 \ or \ x'_2 \ or \ x'_3 \ = true$$
$$x'_1 \ or \ x'_2 \ or \ x_4 \ = true$$

can to reduce any SAT problem to this form

ILP. Given a system of linear inequalities, find a 0-1 solution.

$$1 \ \le \ (1 - x_1) \ + \ x_2 \ + \ x_3$$
$$1 \ \le \ x_1 \ + \ (1 - x_2) \ + \ x_3$$
$$1 \ \le \ (1 - x_1) \ + \ (1 - x_2) \ + \ (1 - x_3)$$
$$1 \ \le \ (1 - x_1) \ + \ (1 - x_2) \ + \ x_4$$

solution to this ILP instance gives solution to original SAT instance

Stephen Cook
'82 Turing award

Leonid Levin

All of these problems (and many, many more) poly-time reduce to SAT.
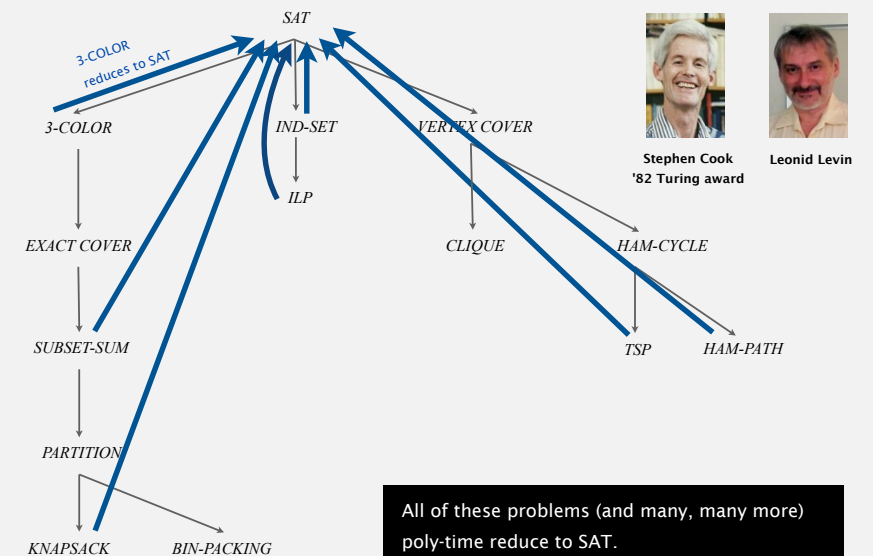

Implications of Karp + Cook-Levin

All of these problems are NP-complete; they are manifestations of the same really hard problem.
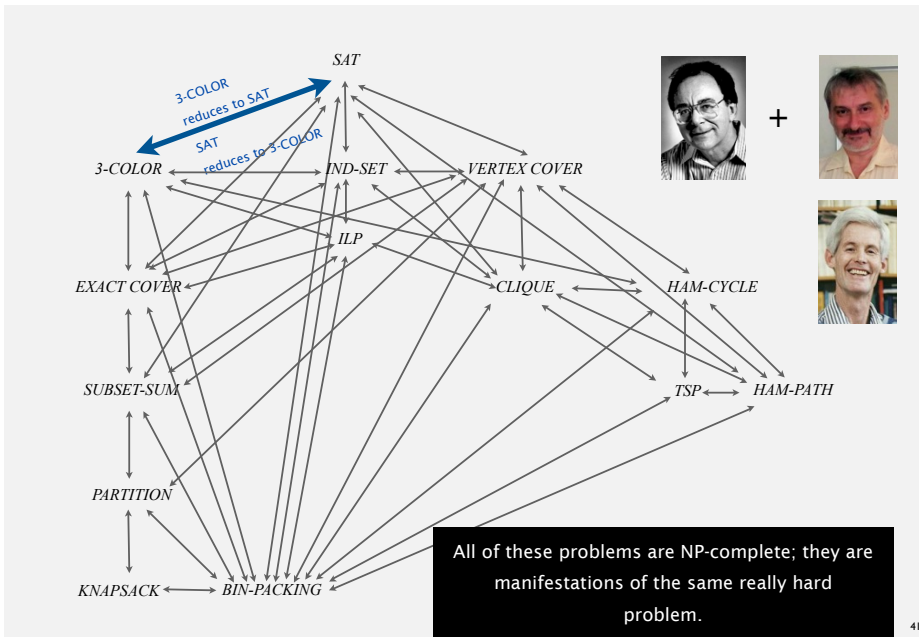

Implications of NP-Completeness

Implication. [SAT captures difficulty of whole class NP]
- Poly-time algorithm for SAT iff P = NP.
- No poly-time algorithm for some NP problem ⇒ none for SAT.

Remark. Can replace SAT with any of Karp's problems.

Proving a problem NP-complete guides scientific inquiry.
- 1926: Ising introduces simple model for phase transitions.
- 1944: Onsager finds closed form solution to 2D version in tour de force.
- 19xx: Feynman and other top minds seek 3D solution.
- 2000: 3D-ISING proved NP-complete.

a holy grail of statistical mechanics

search for closed formula appears doomed

Two worlds (more detail)

Overwhelming consensus (still). P ≠ NP.

P ≠ NP

P = NP

Why we believe P ≠ NP.

" *We admire Wiles' proof of Fermat's last theorem, the scientific theories of Newton, Einstein, Darwin, Watson and Crick, the design of the Golden Gate bridge and the Pyramids, precisely because they seem to require a leap which cannot be made by everyone, let alone a by simple mechanical device.* "   — *Avi Wigderson*

Summary

P. Class of search problems solvable in poly-time.
NP. Class of all search problems, some of which seem wickedly hard.
NP-complete. Hardest problems in NP.
Intractable. Problem with no poly-time algorithm.

Many fundamental problems are NP-complete.
- SAT, ILP, HAMILTON-PATH, …
- 3D-ISING, …

Use theory a guide:
- A poly-time algorithm for an NP-complete problem would be a stunning breakthrough (a proof that P = NP).
- You will confront NP-complete problems in your career.
- Safe to assume that P ≠ NP and that such problems are intractable.
- Identify these situations and proceed accordingly.

Exploiting intractability

Modern cryptography.
- Ex. Send your credit card to Amazon.
- Ex. Digitally sign an e-document.
- Enables freedom of privacy, speech, press, political association.

RSA cryptosystem.
- To use: multiply two n-bit integers. [poly-time]
- To break: factor a 2 n-bit integer. [unlikely poly-time]

Multiply = EASY
23×67 ⟷ $1,541$

Factor = HARD
45

Exploiting intractability

Challenge. Factor this number.

7403756347956171282804679609742957314259318888923128908493623263897276503402826627689199641962511784399589433050212758537011896809828673317327310893090055250511687706329907239638078671008609696253793465056379 6359

RSA-704
($30,000 prize if you can factor)

Can't do it? Create a company based on the difficulty of factoring.

P & Q PRIME
N = PQ
ED ≡ 1 MOD (P-1)(Q-1)
C ≡ M^E MOD N
M ≡ C^D MOD N

The RSA algorithm is the most widely used method of implementing public key cryptography and has been deployed in more than one billion applications worldwide.

RSA algorithm

RSA sold for $2.1 billion

or design a t-shirt

46

Exploiting intractability

FACTOR. Given an n-bit integer x, find a nontrivial factor.

Q. What is complexity of FACTOR?
A. In NP, but not known (or believed) to be in P or NP-complete.

Q. What if P = NP?
A. Poly-time algorithm for factoring; modern e-conomy collapses.

Proposition. [Shor 1994] Can factor an n-bit integer in n^3 steps on a "quantum computer."

Q. Do we still believe the extended Church-Turing thesis???

47

Coping with intractability

Relax one of desired features.
- Solve arbitrary instances of the problem.
- Solve the problem to optimality.
- Solve the problem in poly-time.

Special cases may be tractable.
- Ex: Linear time algorithm for 2-SAT. ← at most two variables per equation
- Ex: Linear time algorithm for Horn-SAT. ← at most one un-negated variable per equation

48

Coping with intractability

Relax one of desired features.
- Solve arbitrary instances of the problem.
- Solve the problem to optimality.
- Solve the problem in poly-time.

Develop a heuristic, and hope it produces a good solution.
- No guarantees on quality of solution.
- Ex. TSP assignment heuristics.
- Ex. Metropolis algorithm, simulating annealing, genetic algorithms.

Approximation algorithm. Find solution of provably good quality.
- Ex. MAX-3SAT: provably satisfy 87.5% as many clauses as possible.

but if you can guarantee to satisfy 87.51% as many clauses as possible in poly-time, then P = NP !

Coping with intractability

Relax one of desired features.
- Solve arbitrary instances of the problem.
- Solve the problem to optimality.
- Solve the problem in poly-time.

Complexity theory deals with worst case behavior.
- Instance(s) you want to solve may be "easy."
- Chaff solves real-world SAT instances with ~ 10K variable.

ABSTRACT
Boolean Satisfiability is probably the most studied of combinatorial optimization/search problems. Significant effort has been devoted to trying to provide practical solutions to this problem for problem instances encountered in a range of applications in Electronic Design Automation (EDA), as well as in Artificial Intelligence (AI). This study has culminated in the

Many publicly available SAT solvers (e.g. GRASP [8], POSIT [5], SATO [13], rel_sat [2], WalkSAT [9]) have been developed, most employing some combination of two main strategies: the Davis-Putnam (DP) backtrack search and heuristic local search. Heuristic local search techniques are not guaranteed to be complete (i.e. they are not guaranteed to find a satisfying assignment if one exists or prove unsatisfiability); as a

---

Combinatorial search

Exhaustive search. Iterate through all elements of a search space.

Applicability. Huge range of problems (include intractable ones).

Caveat. Search space is typically exponential in size $\Rightarrow$ effectiveness may be limited to relatively small instances.

Backtracking. Systematic method for examining feasible solutions to a problem, by systematically pruning infeasible ones.

N-rooks problem

Q. How many ways are there to place N rooks on an N-by-N board so that no rook can attack any other?

a[4] = 6 means the rook from row 4 is in column 6

```
int[] a = { 2, 0, 1, 3, 6, 7, 4, 5 };
```

Representation. No two rooks in the same row or column $\Rightarrow$ permutation.

Challenge. Enumerate all $N!$ permutations of N integers 0 to $N - 1$.

Enumerating permutations

Recursive algorithm to enumerate all $N!$ permutations of N elements.

- Start with permutation `a[0]` to `a[N-1]`.
- For each value of `i`:
  - swap `a[i]` into position 0
  - enumerate all $(N-1)!$ permutations of `a[1]` to `a[N-1]`
  - clean up (swap `a[i]` back to original position)

```
            N = 3        0 followed by   1 followed by   2 followed by   3 followed by
                         perms of 1 2 3  perms of 0 2 3  perms of 1 0 3  perms of 1 2 0
   N = 2     0  1 2
             0  2 1
  0 1        0 1 2       0  1 2 3       1  0 2 3       2  1 0 3       3  1 2 0
  1 0        1  0 2      0  1 3 2       1  0 3 2       2  1 3 0       3  1 0 2
  0 1        1  2 0      0  2 1 3       1  2 0 3       2  0 1 3       3  2 1 0
             1 0 2       0  2 3 1       1  2 3 0       2  0 3 1       3  2 0 1
             0 1 2       0  3 2 1       1  3 2 0       2  3 0 1       3  0 2 1
             2  1 0      0  3 1 2       1  3 0 2       2  3 1 0       3  0 1 2
             2  0 1
             2 1 0
             0 1 2
```

cleanup swaps that bring

Enumerating permutations
```
public class Rooks
{
    private int N;
    private int[] a;  // bits (0 or 1)

    public Rooks(int N)
    {
        this.N = N;
        a = new int[N];
        for (int i = 0; i < N; i++)
            a[i] = i;          <-- initial permutation
        enumerate(0);
    }

    private void enumerate(int k)
    { /* see previous slide */  }

    private void exch(int i, int j)
    {  int t = a[i]; a[i] = a[j]; a[j] = t;  }

    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        new Rooks(N);
    }
}
```
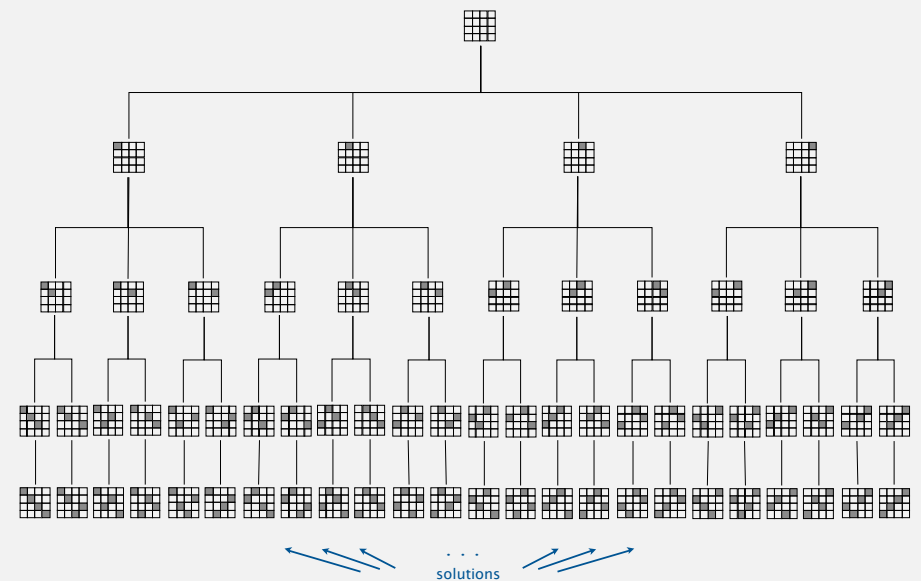

```
% java Rooks 2
0 1
1 0

% java Rooks 3
0 1 2
0 2 1
1 0 2
1 2 0
2 1 0
2 0 1

4-rooks search tree

. . .
solutions

56

N-rooks problem: back-of-envelope running time estimate

Slow way to compute $N!$.

```
% java Rooks 7 | wc -l          ← instant
5040

% java Rooks 8 | wc -l          ← 1.6 seconds
40320

% java Rooks 9 | wc -l          ← 15 seconds
362880

% java Rooks 10 | wc -l         ← 170 seconds
3628800

% java Rooks 25 | wc -l         ← forever
...
```
Hypothesis. Running time is about $2\,(N!\,/\,8!\,)$ seconds.

N-queens problem

Q. How many ways are there to place N queens on an N-by-N board so that no queen can attack any other?

a[1] = 6 means the queen from row 1 is in column 6

```
int[] a = { 2, 7, 3, 6, 0, 5, 1, 4 };
```

Representation. No two queens in the same row or column $\Rightarrow$ permutation.

Additional constraint. No diagonal attack is possible.

← unlike N-rooks problem, nobody knows answer for N > 30
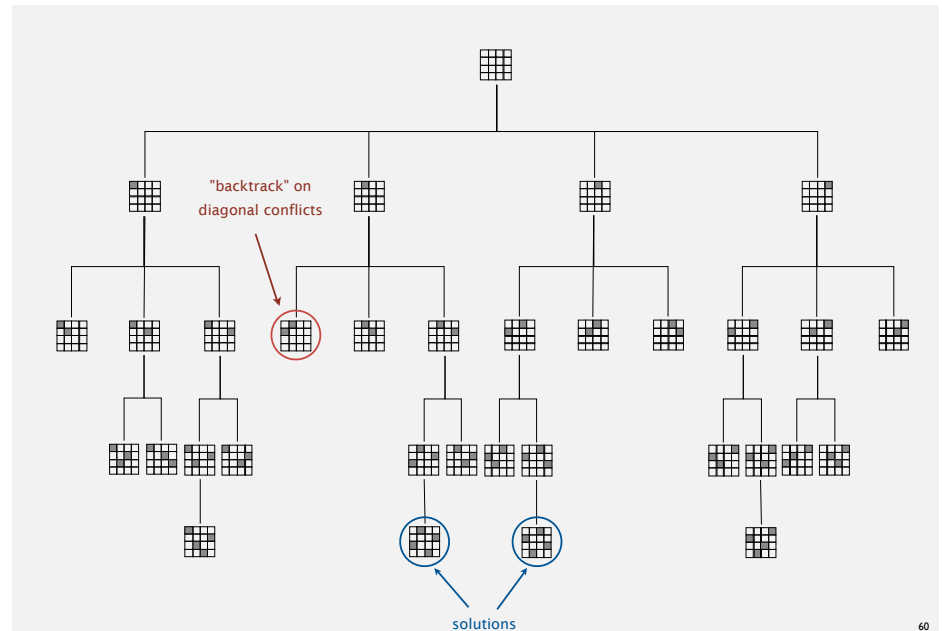

Challenge. Enumerate (or even count) the solutions.

4-queens search tree

diagonal conflict on partial solution: no point going deeper

solutions

4-queens search tree (pruned)

"backtrack" on diagonal conflicts

solutions

Backtracking

Backtracking paradigm. Iterate through elements of search space.
- When there are several possible choices, make one choice and recur.
- If the choice is a dead end, backtrack to previous choice,
  and make next available choice.

Benefit. Identifying dead ends allows us to prune the search tree.

Ex. [backtracking for N-queens problem]
- Dead end: a diagonal conflict.
- Pruning: backtrack and try next column when diagonal conflict found.

Applications. Puzzles, combinatorial optimization, parsing, ...

N-queens problem: backtracking solution

```
private boolean canBacktrack(int k)
{
    for (int i = 0; i < k; i++)
    {
        if ((a[i] - a[k]) == (k - i)) return true;
        if ((a[k] - a[i]) == (k - i)) return true;
    }
    return false;
}

// place N-k queens in a[k] to a[N-1]
private void enumerate(int k)
{
    if (k == N)
    {  process(); return;  }

    for (int i = k; i < N; i++)
    {
        exch(k, i);
        if (!canBacktrack(k)) enumerate(k+1);
        exch(i, k);
    }
}
```

stop enumerating if adding queen k leads to a diagonal violation

```
% java Queens 4
1 3 0 2
2 0 3 1

% java Queens 5
0 2 4 1 3
0 3 1 4 2
1 3 0 2 4
1 4 2 0 3
2 0 3 1 4
2 4 1 3 0
3 1 4 2 0
3 0 2 4 1
4 1 3 0 2
4 2 0 3 1

% java Queens 6
1 3 5 0 2 4
2 5 1 4 0 3
3 0 4 1 5 2
4 2 0 5 3 1
```

a[0]   a[N-1]

## N-queens problem: effectiveness of backtracking

Pruning the search tree leads to enormous time savings.

N	Q(N)	N!
2	0	2
3	0	6
4	2	24
5	10	120
6	4	720
7	40	5,040
8	92	40,320
9	352	362,880
10	724	3,628,800
11	2,680	39,916,800
12	14,200	479,001,600
13	73,712	6,227,020,800
14	365,596	87,178,291,200

Hamilton path

Goal. Find a simple path that visits every vertex exactly once.

visit every edge exactly once

Remark. Euler path easy, but Hamilton path is NP-complete.

Hamilton path: backtracking solution

Backtracking solution. To find Hamilton path starting at v :

- Add v to current path.
- For each vertex w adjacent to v
  - find a simple path starting at w using all remaining vertices
- Clean up: remove v from current path.

Q. How to implement?
A. Add cleanup to DFS (!!)

Hamilton path: Java implementation

```java
public class HamiltonPath
{
    private boolean[] marked;    // vertices on current path
    private int count = 0;       // number of Hamiltonian paths

    public HamiltonPath(Graph G)
    {
        marked = new boolean[G.V()];
        for (int v = 0; v < G.V(); v++)
            dfs(G, v, 1);
    }

    private void dfs(Graph G, int v, int depth)
    {
        marked[v] = true;
        if (depth == G.V()) count++;

        for (int w : G.adj(v))
            if (!marked[w]) dfs(G, w, depth+1);

        marked[v] = false;
    }
}
```

length of current path
(depth of recursion)

found one
