## Fundamentals of Image Processing

Erkut Erdem  
Dept. of Computer Engineering  
Hacettepe University

### Segmentation – Part 2

### Review- Image segmentation

- Goal: identify groups of pixels that go together

Slide credit: S. Seitz, K. Grauman

### Review- The goals of segmentation

- Separate image into coherent “objects”

image

human segmentation

### Review- What is segmentation?

- Clustering image elements that “belong together”
  - Partitioning
    - Divide into regions/sequences with coherent internal properties
  - Grouping
    - Identify sets of coherent tokens in image

## Review- K-means clustering

- Basic idea: randomly initialize the  $k$  cluster centers, and iterate between the two steps we just saw.

1. Randomly initialize the cluster centers,  $c_1, \dots, c_k$
2. Given cluster centers, determine points in each cluster
  - For each point  $p$ , find the closest  $c_i$ . Put  $p$  into cluster  $i$
3. Given points in each cluster, solve for  $c_i$ 
  - Set  $c_i$  to be the mean of points in cluster  $i$
4. If  $c_i$  have changed, repeat Step 2

### Properties

- Will always converge to *some* solution
- Can be a “local minimum”
  - does not always find the global minimum of objective function:

$$\sum_{\text{clusters } i} \sum_{\text{points } p \text{ in cluster } i} \|p - c_i\|^2$$

Slide credit: S. Seitz

## Review - K-means: pros and cons

### Pros

- Simple, fast to compute
- Converges to local minimum of within-cluster squared error

### Cons/issues

- Setting  $k$ ?
- Sensitive to initial centers
- Sensitive to outliers
- Detects spherical clusters
- Assuming means can be computed

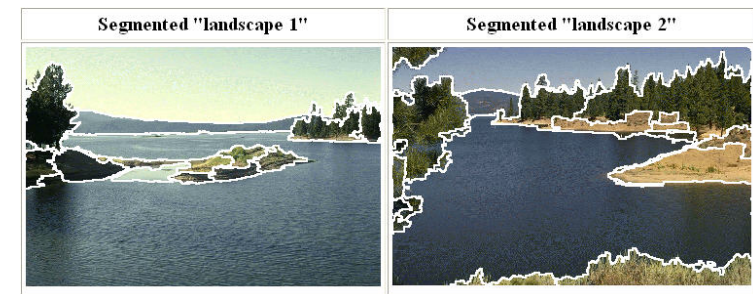

Slide credit: K Grauman

## Segmentation methods

- Segment foreground from background
- Histogram-based segmentation
- Segmentation as clustering
  - K-means clustering
  - Mean-shift segmentation
- Graph-theoretic segmentation
  - Min cut
  - Normalized cuts
- Interactive segmentation

## Mean shift clustering and segmentation

- An advanced and versatile technique for clustering-based segmentation

<http://www.caip.rutgers.edu/~comanici/MSPAMI/msPamiResults.html>

D. Comaniciu and P. Meer, [Mean Shift: A Robust Approach toward Feature Space Analysis](#), PAMI 2002.

Slide credit: S. Lazebnik

## Finding Modes in a Histogram

- How Many Modes Are There?
  - Easy to see, hard to compute

Slide credit: S. Seitz

## Mean shift algorithm

- The mean shift algorithm seeks *modes* or local maxima of density in the feature space

Slide credit: S. Lazebnik

## Mean shift algorithm

### Mean Shift Algorithm

1. Choose a search window size.
2. Choose the initial location of the search window.
3. Compute the mean location (centroid of the data) in the search window.
4. Center the search window at the mean location computed in Step 3.
5. Repeat Steps 3 and 4 until convergence.

The mean shift algorithm seeks the “mode” or point of highest density of a data distribution:

Two issues:

- (1) Kernel to interpolate density based on sample positions.
- (2) Gradient ascent to mode.

Slide credit: B. Freeman and A. Torralba

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift clustering

- Cluster: all data points in the attraction basin of a mode
- Attraction basin: the region for which all trajectories lead to the same mode

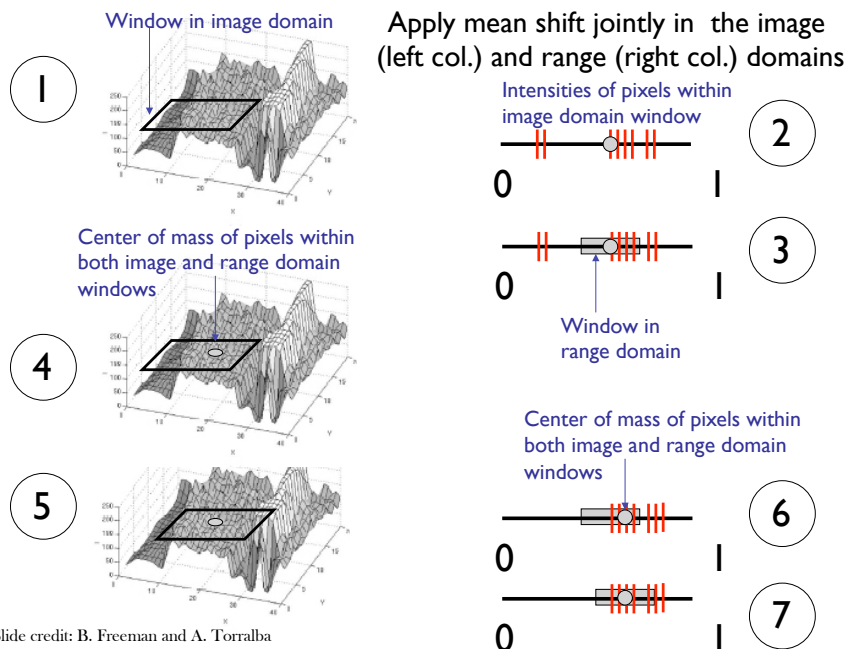

Slide credit: Y. Ukrainitz & B. Sarel

## Mean shift clustering/segmentation

- Find features (color, gradients, texture, etc)
- Initialize windows at individual feature points
- Perform mean shift for each window until convergence
- Merge windows that end up near the same “peak” or mode

Slide credit: S. Lazebnik

Slide credit: B. Freeman and A. Torralba

Fig. 4. Visualization of mean shift-based filtering and segmentation for gray-level data. (a) Input. (b) Mean shift paths for the pixels on the plateau and on the line. The black dots are the points of convergence. (c) Filtering result  $(h_s, h_r) = (8, 4)$ . (d) Segmentation result.

Comaniciu and Meer, IEEE PAMI vol. 24, no. 5, 2002

## Mean shift segmentation results

<http://www.caip.rutgers.edu/~comanici/MSPAMI/msPamiResults.html>

Slide credit: S. Lazebnik

## More results

Slide credit: S. Lazebnik

## More results

Slide credit: S. Lazebnik

## Mean shift pros and cons

- Pros
  - Does not assume spherical clusters
  - Just a single parameter (window size)
  - Finds variable number of modes
  - Robust to outliers
- Cons
  - Output depends on window size
  - Computationally expensive
  - Does not scale well with dimension of feature space

Slide credit: S. Lazebnik

## Segmentation methods

- Segment foreground from background
- Histogram-based segmentation
- Segmentation as clustering
  - K-means clustering
  - Mean-shift segmentation
- Graph-theoretic segmentation
  - Min cut
  - Normalized cuts
- Interactive Segmentation

## Graph-Theoretic Image Segmentation

Build a weighted graph  $G=(V,E)$  from image

$V$ : image pixels

$E$ : connections between pairs of nearby pixels

$W_{ij}$ : probability that  $i$  &  $j$  belong to the same region

Segmentation = graph partition

Slide credit: B. Freeman and A. Torralba

## Graphs Representations

	a	b	c	d	e
a	0	1	0	0	1
b	1	0	0	0	0
c	0	0	0	0	1
d	0	0	0	0	1
e	1	0	1	1	0

Adjacency Matrix

Slide credit: B. Freeman and A. Torralba

\* From Khurram Hassan-Shafique CAP5415 Computer Vision 2003

## A Weighted Graph and its Representation

Affinity Matrix

$$W = \begin{bmatrix} 1 & .1 & .3 & 0 & 0 \\ .1 & 1 & .4 & 0 & .2 \\ .3 & .4 & 1 & .6 & .7 \\ 0 & 0 & .6 & 1 & 1 \\ 0 & .2 & .7 & 1 & 1 \end{bmatrix}$$

$W_{ij}$  : probability that i & j  
belong to the same  
region

Slide credit: B. Freeman and A. Torralba

\* From Khurram Hassan-Shafique CAP5415 Computer Vision 2003

## Segmentation by graph partitioning

- Break graph into segments
  - Delete links that cross between segments
  - Easiest to break links that have low affinity
    - similar pixels should be in the same segments
    - dissimilar pixels should be in different segments

Slide credit: S. Seitz

## Affinity between pixels

Similarities among pixel descriptors

$$W_{ij} = \exp(-||z_i - z_j||^2 / \sigma^2)$$

$\sigma$  = Scale factor...  
it will hunt us later

Slide credit: B. Freeman and A. Torralba

## Affinity between pixels

Similarities among pixel descriptors

$$W_{ij} = \exp(-\|z_i - z_j\|^2 / \sigma^2)$$

Interleaving edges

$$W_{ij} = 1 - \max_{\text{Line between } i \text{ and } j} P_b$$

With  $P_b$  = probability of boundary

$\sigma$  = Scale factor...  
it will hunt us later

Slide credit: B. Freeman and A. Torralba

## Scale affects affinity

- Small  $\sigma$ : group only nearby points
- Large  $\sigma$ : group far-away points

Slide credit: S. Lazebnik

## Feature grouping by “relocalisation” of eigenvectors of the proximity matrix

British Machine Vision Conference, pp. 103-108, 1990

Guy L. Scott  
Robotics Research Group  
Department of Engineering Science  
University of Oxford

H. Christopher Longuet-Higgins  
University of Sussex  
Falmer  
Brighton

Three points in feature space

$$W_{ij} = \exp(-\|z_i - z_j\|^2 / s^2)$$

With an appropriate  $s$

$$W = \begin{array}{c|ccc} & A & B & C \\ \hline A & 1.00 & 0.63 & 0.03 \\ B & 0.63 & 1.00 & 0.0 \\ C & 0.03 & 0.0 & 1.00 \end{array}$$

The eigenvectors of  $W$  are:

	$E_1$	$E_2$	$E_3$
Eigenvalues	1.63	1.00	0.37
A	-0.71	-0.01	0.71
B	-0.71	-0.05	-0.71
C	-0.04	1.00	-0.03

The first 2 eigenvectors group the points as desired...

## Example eigenvector

points

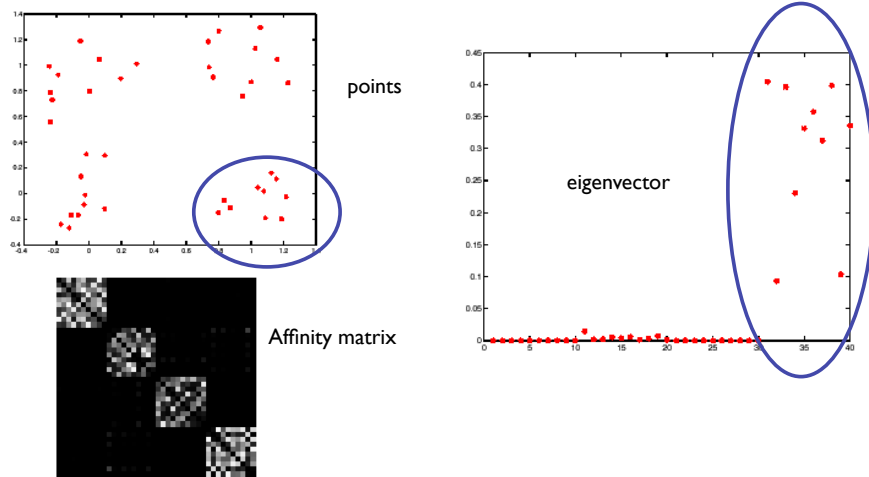

Affinity matrix

eigenvector

Slide credit: B. Freeman and A. Torralba

## Example eigenvector

Slide credit: B. Freeman and A. Torralba

## Graph cut

- Set of edges whose removal makes a graph disconnected
- Cost of a cut: sum of weights of cut edges
- A graph cut gives us a segmentation
  - What is a “good” graph cut and how do we find one?

Slide credit: S. Seitz

## Segmentation methods

- Segment foreground from background
- Histogram-based segmentation
- Segmentation as clustering
  - K-means clustering
  - Mean-shift segmentation
- Graph-theoretic segmentation
  - Min cut
  - Normalized cuts
- Interactive segmentation

## Minimum cut

A cut of a graph  $G$  is the set of edges  $S$  such that removal of  $S$  from  $G$  disconnects  $G$ .

**Cut:** sum of the weight of the cut edges:

$$cut(A,B) = \sum_{u \in A, v \in B} W(u,v),$$

with  $A \cap B = \emptyset$

Slide credit: B. Freeman and A. Torralba

## Minimum cut

- We can do segmentation by finding the *minimum cut* in a graph
  - Efficient algorithms exist for doing this

Slide credit: S. Lazebnik

## Minimum cut

- We can do segmentation by finding the *minimum cut* in a graph
  - Efficient algorithms exist for doing this

Slide credit: S. Lazebnik

## Drawbacks of Minimum cut

- Weight of cut is directly proportional to the number of edges in the cut.

Slide credit: B. Freeman and A. Torralba

\* Slide from Khurram Hassan-Shafique CAP5415 Computer Vision 2003

## Segmentation methods

- Segment foreground from background
- Histogram-based segmentation
- Segmentation as clustering
  - K-means clustering
  - Mean-shift segmentation
- Graph-theoretic segmentation
  - Min cut
  - Normalized cuts
- Interactive segmentation

## Normalized cuts

Write graph as  $V$ , one cluster as  $A$  and the other as  $B$

$$Ncut(A,B) = \frac{cut(A,B)}{assoc(A,V)} + \frac{cut(A,B)}{assoc(B,V)}$$

$cut(A,B)$  is sum of weights with one end in  $A$  and one end in  $B$

$$cut(A,B) = \sum_{u \in A, v \in B} W(u,v),$$

with  $A \cap B = \emptyset$

$assoc(A,V)$  is sum of all edges with one end in  $A$ .

$$assoc(A,B) = \sum_{u \in A, v \in B} W(u,v)$$

$A$  and  $B$  not necessarily disjoint

J. Shi and J. Malik. [Normalized cuts and image segmentation](#). PAMI 2000

Slide credit: B. Freeman and A. Torralba

## Normalized cut

- Let  $W$  be the adjacency matrix of the graph
- Let  $D$  be the diagonal matrix with diagonal entries  $D(i, i) = \sum_j W(i, j)$
- Then the normalized cut cost can be written as

$$\frac{y^T (D - W) y}{y^T D y}$$

where  $y$  is an indicator vector whose value should be 1 in the  $i$ th position if the  $i$ th feature point belongs to  $A$  and a negative constant otherwise

J. Shi and J. Malik. [Normalized cuts and image segmentation](#). PAMI 2000

Slide credit: S. Lazebnik

## Normalized cut

- Finding the exact minimum of the normalized cut cost is NP-complete, but if we *relax*  $y$  to take on arbitrary values, then we can minimize the relaxed cost by solving the *generalized eigenvalue problem*  $(D - W)y = \lambda Dy$
- The solution  $y$  is given by the generalized eigenvector corresponding to the second smallest eigenvalue
- Intuitively, the  $i$ th entry of  $y$  can be viewed as a “soft” indication of the component membership of the  $i$ th feature
  - Can use 0 or median value of the entries as the splitting point (threshold), or find threshold that minimizes the  $Ncut$  cost

J. Shi and J. Malik. [Normalized cuts and image segmentation](#). PAMI 2000

Slide credit: S. Lazebnik

## Normalized cut algorithm

- Given an image or image sequence, set up a weighted graph  $G = (V, E)$ , and set the weight on the edge connecting two nodes being a measure of the similarity between the two nodes.
- Solve  $(D - W)x = \lambda Dx$  for eigenvectors with the smallest eigenvalues.
- Use the eigenvector with second smallest eigenvalue to bipartition the graph.
- Decide if the current partition should be sub-divided, and recursively repartition the segmented parts if necessary.

Slide credit: B. Freeman and A. Torralba

## Global optimization

- In this formulation, the segmentation becomes a global process.
- Decisions about what is a boundary are not local (as in Canny edge detector)

Slide credit: B. Freeman and A. Torralba

## Boundaries of image regions defined by a number of attributes

- Brightness/color
- Texture
- Motion
- Stereoscopic depth
- Familiar configuration

[Malik]

Slide credit: B. Freeman and A. Torralba

## Example

Affinity:

$$w_{ij} = e^{\underbrace{\frac{-\|F(i)-F(j)\|_2^2}{\sigma_I}}_{\text{brightness}}} * \underbrace{\begin{cases} e^{\frac{-\|X(i)-X(j)\|_2^2}{\sigma_X}} & \text{if } \|X(i) - X(j)\|_2 < r \\ 0 & \text{otherwise} \end{cases}}_{\text{Location}}$$

N pixels = ncols \* nrows

Slide credit: B. Freeman and A. Torralba

Figure 12: Subplot (1) plots the smallest eigenvectors of the generalized eigenvalue system (11). Subplot (2) - (9) shows the eigenvectors corresponding the 2nd smallest to the 9th smallest eigenvalues of the system. The eigenvectors are reshaped to be the size of the image.

Slide credit: B. Freeman and A. Torralba

## Brightness Image Segmentation

converge. On the  $100 \times 120$  test images shown here, the normalized cut algorithm takes about 2 minutes on Intel Pentium 200MHz machines.

A multiresolution implementation can be used to reduce this running time further on larger images. In our current experiments, with this implementation, the running time on a  $300 \times 400$  image can be reduced to about 20 seconds on Intel Pentium 300MHz machines. Furthermore, the bottleneck of the computation, a sparse matrix-vector

## Intelligent Scissors [Mortensen 95]

- Approach answers a basic question
  - Q: how to find a path from seed to mouse that follows object boundary as closely as possible?

Figure 2: Image demonstrating how the live-wire segment adapts and snaps to an object boundary as the free point moves (via cursor movement). The path of the free point is shown in white. Live-wire segments from previous free point positions ( $t_0$ ,  $t_1$ , and  $t_2$ ) are shown in green.

Mortensen and Barrett, Intelligent Scissors for Image Composition, Proc. 22nd annual conference on Computer graphics and interactive techniques, 1995

Slide credit: S. Seitz

## Intelligent Scissors

- Basic Idea
  - Define edge score for each pixel
    - edge pixels have low cost
  - Find lowest cost path from seed to mouse

### Questions

- How to define costs?
- How to find the path?

Slide credit: S. Seitz

## Path Search (basic idea)

- Graph Search Algorithm
  - Computes minimum cost path from seed to *all other pixels*

Slide credit: S. Seitz

## How does this really work?

- Treat the image as a graph

### Graph

- node for every pixel **p**
- link between every adjacent pair of pixels, **p,q**
- cost **c** for each link

Note: each *link* has a cost

- this is a little different than the figure before where each pixel had a cost

Slide credit: S. Seitz

## Defining the costs

- Treat the image as a graph

Want to hug image edges: how to define cost of a link?

- the link should follow the intensity edge
  - want intensity to change rapidly  $\perp$  to the link
- $c \approx -|\text{difference of intensity } \perp \text{ to link}|$

Slide credit: S. Seitz

## Defining the costs

- $c$  can be computed using a cross-correlation filter
  - assume it is centered at  $p$
- Also typically scale  $c$  by its length
  - set  $c = (\text{max} - |\text{filter response}|)$ 
    - where max = maximum |filter response| over all pixels in the image

Slide credit: S. Seitz

## Defining the costs

- $c$  can be computed using a cross-correlation filter
  - assume it is centered at  $p$
- Also typically scale  $c$  by its length
  - set  $c = (\text{max} - |\text{filter response}|)$ 
    - where max = maximum |filter response| over all pixels in the image

Slide credit: S. Seitz

## Dijkstra's shortest path algorithm

Algorithm

- init node costs to  $\infty$ , set  $p$  = seed point,  $\text{cost}(p) = 0$
- expand  $p$  as follows:
  - for each of  $p$ 's neighbors  $q$  that are not expanded
    - set  $\text{cost}(q) = \min(\text{cost}(p) + c_{pq}, \text{cost}(q))$

Slide credit: S. Seitz

## Dijkstra's shortest path algorithm

### Algorithm

1. init node costs to  $\infty$ , set  $p$  = seed point,  $\text{cost}(p) = 0$
2. expand  $p$  as follows:
  - for each of  $p$ 's neighbors  $q$  that are not expanded
    - » set  $\text{cost}(q) = \min(\text{cost}(p) + c_{pq}, \text{cost}(q))$
    - » if  $q$ 's cost changed, make  $q$  point back to  $p$
  - » put  $q$  on the ACTIVE list (if not already there)

Slide credit: S. Seitz

## Dijkstra's shortest path algorithm

### Algorithm

1. init node costs to  $\infty$ , set  $p$  = seed point,  $\text{cost}(p) = 0$
2. expand  $p$  as follows:
  - for each of  $p$ 's neighbors  $q$  that are not expanded
    - » set  $\text{cost}(q) = \min(\text{cost}(p) + c_{pq}, \text{cost}(q))$
    - » if  $q$ 's cost changed, make  $q$  point back to  $p$
  - » put  $q$  on the ACTIVE list (if not already there)
3. set  $r$  = node with minimum cost on the ACTIVE list
4. repeat Step 2 for  $p = r$

Slide credit: S. Seitz

## Dijkstra's shortest path algorithm

### Algorithm

1. init node costs to  $\infty$ , set  $p$  = seed point,  $\text{cost}(p) = 0$
2. expand  $p$  as follows:
  - for each of  $p$ 's neighbors  $q$  that are not expanded
    - » set  $\text{cost}(q) = \min(\text{cost}(p) + c_{pq}, \text{cost}(q))$
    - » if  $q$ 's cost changed, make  $q$  point back to  $p$
  - » put  $q$  on the ACTIVE list (if not already there)
3. set  $r$  = node with minimum cost on the ACTIVE list
4. repeat Step 2 for  $p = r$

Slide credit: S. Seitz

## Segmentation by min (s-t) cut

### • Graph

- node for each pixel, link between pixels
- specify a few pixels as foreground and background
  - create an infinite cost link from each bg pixel to the "t" node
  - create an infinite cost link from each fg pixel to the "s" node
- compute min cut that separates  $s$  from  $t$
- how to define link cost between neighboring pixels?
