## FUNDAMENTALS OF COMPUTATIONAL PHOTOGRAPHY

Lecture #11 – Visual Quality Assessment

HACETTEPE  
UNIVERSITY  
COMPUTER  
VISION LAB

Erkut Erdem // Hacettepe University // Spring 2023

# Today's Lecture

- Introduction about image quality assessment (IQA)
- Full-reference IQA models
- No-reference IQA models
- The Perception-Distortion Tradeoff
- What makes a great picture?

**Disclaimer:** The material and slides for this lecture were borrowed from

—Alexei Efros's CS194-26/294-26 "Intro to Computer Vision and Computational Photography" class

—Kede Ma and Yuming Fang's "Image Quality Assessment in the Modern Age" tutorial at ACM MM 2021

# Introduction about image quality assessment

# What is Image Quality Assessment?

# Image Restoration (IR) and Image Quality Assessment (IQA)

- **Image Restoration (IR)** aims at recovering a high-quality image from its degraded observation.
- **Image Quality Assessment (IQA)** methods were developed to measure the distortion/perceptual-quality of images.
- **IQA methods** are widely used to evaluate IR algorithms, e.g., PSNR, SSIM and Perceptual Index (PI).

# Synthetic and Authentic Distortions

Synthetic Distortions: Simulated by Pristine Image

Pristine image

BLUR: level 4

JPEG: level 4

JP2K: level 4

Realistic Distortions: Captured from Mobile Devices

Smartphone Photography

Under-expoüre

Motion blurring

Mixture distortions

# Visual Quality Assessment

- Subjective quality assessment
  - Reliable and accurate quality prediction of visual content
  - Time-consuming, laborious and expensive
  - Not applicable in practical applications
- Objective quality assessment
  - Predict perceived visual quality automatically
  - Applicable in practical applications

# Subjective Image Quality Assessment

- Absolute category rating (ACR)
  - Single stimulus method
  - Test images are presented one at a time without reference information
  - Voting time: less or equal to 10 seconds depending on the voting method
  - Presentation time: 10 seconds depending on the test image content
  - Five-level or nine-level scale overall rating
- Absolute category rating with hidden reference (ACR-HR)
  - The only difference from the ACR method: a reference version of each test image must be included as the test stimulus, which is termed as a hidden reference condition

# Subjective Image Quality Assessment

- Degradation category rating (DCR)
  - Double stimulus method
  - Test images are presented in pairs: one is reference image, while the other is distorted image
  - Voting time: less or equal 10 seconds depending on voting method
  - Presentation time: 10 seconds depending on the image content
  - Five-level scale overall rating

# Subjective Image Quality Assessment

- Pair comparison (PC)
  - Double stimulus method
  - Two test images from two different systems are presented in pair from the same reference image
  - Participants are asked to provide the judgment on which one is preferred in the test pair
  - All possible pairs are compared ( $N$  stimuli  $\rightarrow N(n-1)/2$  pairs)
  - (optional) Convert paired comparison data to scale values

A

B

- Which one do you prefer?

The image shows a user interface for a pair comparison task. It features two buttons, 'A' and 'B', at the top. Button 'A' is a white rectangle with a black border, and button 'B' is a solid blue rectangle. Below the buttons, the text '- Which one do you prefer?' is displayed. The entire interface is set against a light gray background.

# LIVE Dataset

- Reference images: 29. Distorted images: 779.
- Distortion types: 5 (fast fading, Gaussian blur, JP2K, JPEG, white noise)

# CSIQ Dataset

- Reference images: 30. Distorted images: 866.
- Distortion types: 6 (JPEG, JP2K, Gaussian blur, white noise, contrast change, pink noise)

# TID2013 Dataset

- Reference images: 25. Distorted images: 3000.
- Distortion types: 24 (fast fading, Gaussian blur, JP2K, JPEG, white noise, etc.)

# KADID-10K Dataset

- Reference images: 81. Distorted images: 10125.
- Distortion types: 25 (Gaussian blur, JP2K, JPEG, white noise, motion blur,

# Waterloo Exploration Dataset

- Reference images: 4744. Distorted images: 94880.
- Distortion types: 4 (Gaussian blur, JP2K, JPEG, White noise.)

# LIVE Challenge Dataset – Authentic Distortion

- Distorted images: 1162.
- Distortion types: Complex.

# KonIQ-10K Dataset – Authentic Distortion

- Distorted images: 10073.
- Distortion types: Complex.

# SPAQ Dataset – Authentic Distortion

- Distorted images: 11125 (taken by 66 smartphones with 11 manufacturers).
- Distortion types: Complex.

Under-exposure.

Over-exposure

Contrast reduction

Moving object blurring

Sensor noise

Out-of-focus

Camera motion blurring

Mixture distortions

# PIPAL Dataset

- Reference images: 250. Distorted images: 29000.
- Distortion types: 40 (GAN-based image restoration methods).

# Objective Image Quality Assessment

- **Goal:** Build computational models that accurately predict human perception of image quality
  
- Two categories:
  1. Full-reference IQA
  2. No-reference IQA

# Full-Reference IQA

# No-Reference IQA (Blind IQA - BIQA)

Reference image

Distortion

Test image

Quality score

IQA

# Full-reference IQA: From Mean Squared Error to Structural Similarity (and More)

# What is Wrong with MSE?

Image Credit: Berardino

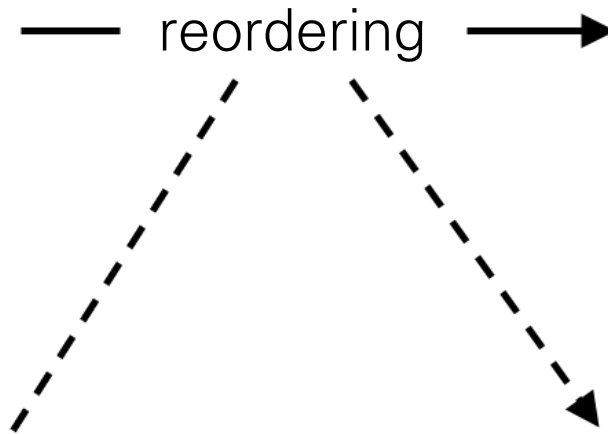

# What is Wrong with MSE?

$$\text{MSE}(x, y) = \frac{1}{N} \sum_{i=1}^N (x_i - y_i)^2 \quad \text{Don't care about pixel ordering}$$

MSE= 1600, SSIM=0.637

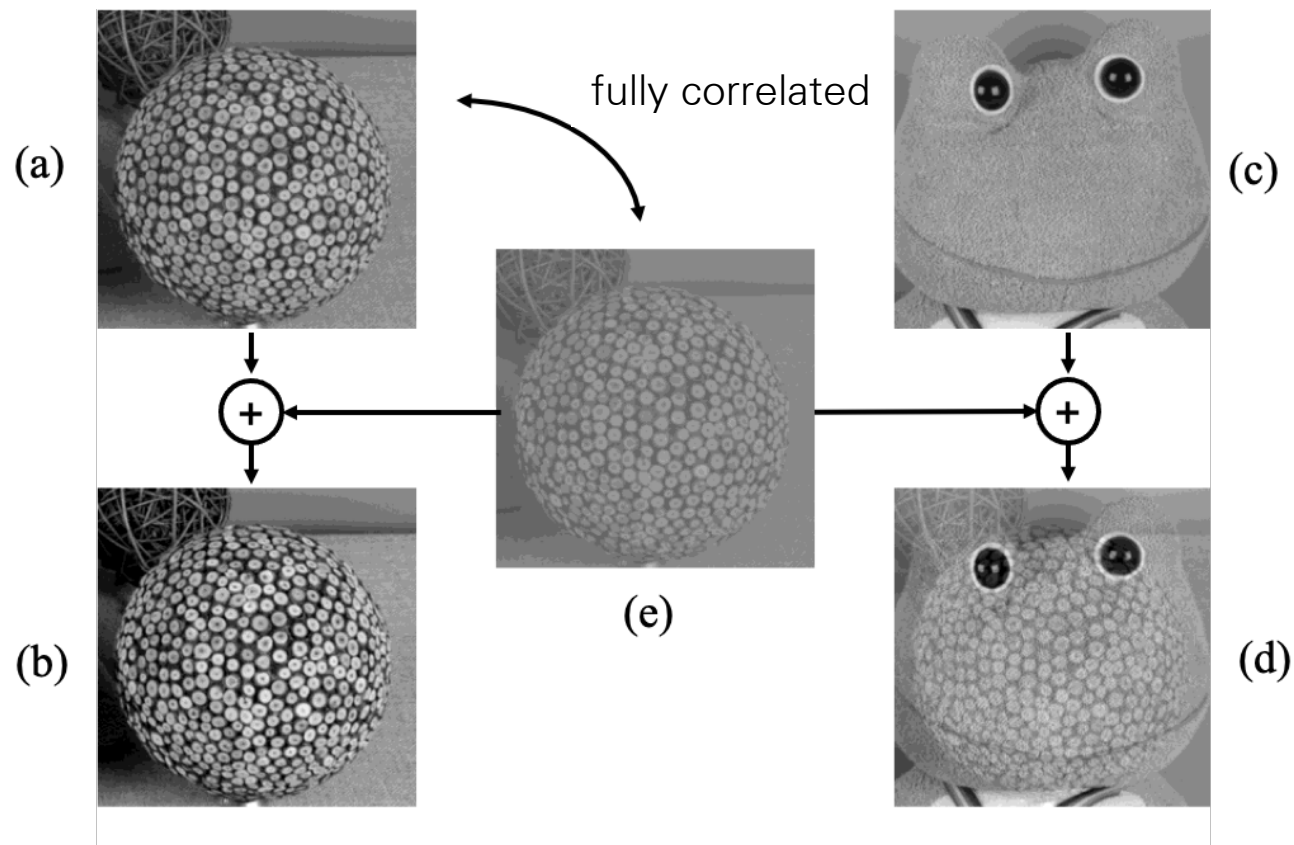

MSE= 1600, SSIM=0.042

# What is Wrong with MSE?

$$\text{MSE}(x, y) = \frac{1}{N} \sum_{i=1}^N (x_i - y_i)^2$$

Care about pixel difference, not the underlying signals

# What is Wrong with MSE?

$$\text{MSE}(x, y) = \frac{1}{N} \sum_{i=1}^N (x_i - y_i)^2$$

Don't care about the sign of pixel difference

+30

MSE= 900,  
SSIM=0.933

+(rand sign)\*30

MSE= 900,  
SSIM=0.247

# What is Wrong with MSE?

- MSE (or the more general Minkowski metric) implicitly assumes that errors are statistically independent
  - True, if spatial dependencies are eliminated prior to computation
  - No easy task as natural images are highly structured (i.e., spatially correlated)
- Possible solution?
  - Learn a “perceptual” transform  $f$ : 
$$D(x, y) = \frac{1}{N} \sum_{i=1}^N (f(x)_i - f(y)_i)^2$$
- Question: What are the desirable properties of  $f$ ?

# Structural Similarity (SSIM)

- Assumption: The human visual system is highly adapted to extract structural information from the viewing field
- Methodology: A measure of structural information change provides a good approximation to perceived image distortion
- Questions:
  - How to define structural (and nonstructural) distortions?
  - How to separate structural and nonstructural distortions?

# The SSIM Index

[Wang et al., 2004]

$$\text{SSIM}(x, y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)}$$

corrupted image

Original image

SSIM map

Absolute error map

# SSIM vs MSE

MSE=0, SSIM=1

MSE=309, SSIM=0.93

MSE=309, SSIM=0.99

MSE=309, SSIM=0.58

MSE=308, SSIM=0.64

MSE=309, SSIM=0.73

# What is Wrong with SSIM?

$$\text{SSIM}(x, y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)}$$

Normalization is sensitive to low intensities

Original image

Distorted image

SSIM map

# What is Wrong with SSIM?

$$\text{SSIM}(\text{c2g}(x), \text{c2g}(y)) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)}$$

Don't consider chrominance

Original image

Distorted image

SSIM map

# What is Wrong with SSIM?

$$\text{SSIM}(x, y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)}$$

Rely on point-by-point comparison

# More Generally

- Not accurate enough
  - MS-SSIM, IW-SSIM, VIF, MAD, FSIM, VSI, NLPD, LPIPS, DISTTS, ...
- Not computationally efficient enough
  - PAMSE, GMSD, ...
- Not misalignment-aware
  - Adaptive linear system, CW-SSIM, GTI-IQA
- Not color-aware
  - Adaptive linear system, FSIM\_c, LPIPS, PieAPP, DISTTS, ...
- Not texture-aware
  - STSIM, NPTSM, VGG Gram, LPIPS, DISTTS, A-DISTTS, ...

# Visual Information Fidelity (VIF)

[Sheikh and Bovik, 2006]

- An information-theoretical approach
- Quantifies the amount of information preserved in the distorted image
- Works when the “distorted” image is visually superior to the reference

$$\text{VIF} = \frac{MI(C; F)}{MI(C; E)}$$

# Most Apparent Distortion (MAD)

[Larson and Chandler, 2010]

- A multi-strategy approach
- A detection based strategy for near-threshold distortions
  - Look past the image and look for the distortions
- An appearance based strategy for clearly visible distortions
  - Look past the distortions and look for the image content

# Normalized Laplacian Pyramid Distance (NLPD)

[Laparra et al., 2016]

- An error visibility method that models the early visual system
- Local luminance subtraction and local gain control
- The SOTA method for high-dynamic-range image tone mapping

$$\text{NLPD}(x, \tilde{x}) = \frac{1}{N} \sum_{k=1}^N \frac{1}{\sqrt{N^{(k)}}} \|y^{(k)} - \tilde{y}^{(k)}\|_2$$

# Learned Perceptual Image Patch Similarity (LPIPS)

[Zhang et al., 2018]

- Investigate a wide range of network architectures and vision tasks
- Demonstrate the effectiveness of deep features in designing IQA models

# Deep Image Structure and Texture Similarity (DISTS)

[Ding et al., 2020]

- Based on an injective mapping function built from a variant of VGG
- SSIM-like global structure and texture similarity measurements
- Robust to texture resampling and mild geometric transformations

$$\text{DISTS}(x, y) = 1 - \sum_{i=0}^m \sum_{j=1}^{n_i} \left( \alpha_{ij} l(\tilde{x}_j^{(i)}, \tilde{y}_j^{(i)}) + \beta_{ij} s(\tilde{x}_j^{(i)}, \tilde{y}_j^{(i)}) \right)$$

# Locally Adaptive DISTs

[Ding et al., 2021]

- Rely on the dispersion index to localize texture regions at different scales

$$\text{A-DISTS}(X, Y) = 1 - \frac{1}{N} \sum_{i=0}^M \sum_{j=1}^{N_i} S\left(\tilde{X}_j^{(i)}, \tilde{Y}_j^{(i)}\right)$$

$$S\left(\tilde{X}_j^{(i)}, \tilde{Y}_j^{(i)}\right) = \frac{1}{K_i} \sum_{k=1}^{K_i} \left( \tilde{p}_k^{(i)} l\left(\tilde{x}_{j,k}^{(i)}, \tilde{y}_{j,k}^{(i)}\right) + \tilde{q}_k^{(i)} s\left(\tilde{x}_{j,k}^{(i)}, \tilde{y}_{j,k}^{(i)}\right) \right)$$

# No-Reference IQA: From Natural Scene Statistics to Learning based Approaches

# Knowledge Map

Question: Do we really wish to leverage knowledge about image distortions?

# Natural Scene Statistics (NSS) based Approaches

- Assumption: Natural images exhibit strong statistical regularities, and reside in a tiny portion of the whole image space
- Methodology: A measure of violation from such statistical regularities provides an approximation to the unnaturalness (i.e., quality) of the image
  1. Handcraft statistical features from the image
  2. Summarize the extracted features using probability distributions (e.g. generalized Gaussian)
  3. Input the fitted parameters to a regression method (e.g, SVM) or compare the fitted distribution to a “reference” distribution

# NSS based Approaches

- Edge intensity/spread, sample entropy, BRISQUE, NIQE, IL-NIQE, ...
  - Spatial domain
- Frequency domain
  - DFT (blur kernel, phase congruency), DCT (BLIINDS-II), ...
- Wavelet domain
  - Local phase coherence, DIIVINE, LBIQ, ...

# Natural Image Quality Evaluator (NIQE)

[Mittal et al., 2013]

- Without reliance on human ratings
- Without exposure to distorted images
- Widely used in real-world image processing

(a)

(b)

(c)

(d)

(e)

$$\text{NIQE} = \sqrt{(\mu_1 - \mu_2)^T \left( \frac{\Sigma_1 + \Sigma_2}{2} \right)^{-1} (\mu_1 - \mu_2)}$$

# (Deep) Learning based Approaches

- Methodology: Joint optimization of feature extraction and quality prediction
- Challenge: the large number of parameters to be optimized and the small number of human ratings as supervisory signals

# (Deep) Learning based Approaches

- Attempt 1: Fine-tune models from other vision tasks (e.g., object recognition)
  - [Bianco, 2018], DB-CNN, UNIQUE, HyperIQA, MetaIQA, ...
- Limitation:
  - Lose the opportunity to search for the optimal and (possibly simpler) network architecture

# (Deep) Learning based Approaches

- Attempt 2: Train no-reference models using image patches
  - CORNIA, [Kang et al., 2014], HOSA, DeepIQA, ...
- Limitation:
  - Local quality generally depends on global context
  - How to obtain a single global score for an image

# (Deep) Learning based Approaches

- Attempt 3: Quality-aware pretraining followed by fine-tuning
  - Leverage distortion information
  - MEON, RankIQA, DB-CNN, ...
- Leverage full-reference models
  - dipIQ, [Kim et al., 2018], [Ma et al., 2019]
- Limitation: Difficult to extend to authentic image distortions

# Evaluation of IQA Models

# Standard Approach

## Main Steps

1. Select a set of images from the image domain of interest
2. Collect the MOS for each image via psychophysical experiments (i.e., subjective user studies)
3. Compare the goodness of fit among the competing IQA models (i.e., sort by average performance)

- Spearman rank correlation coefficient
  - prediction monotonicity
- Pearson linear correlation coefficient
  - prediction linearity
- Mean squared error
  - prediction accuracy

$$\text{SRCC} = 1 - \frac{6 \sum_i d_i^2}{M(M^2 - 1)}$$

$$\text{PLCC}(x, y) = \frac{\sum_i (x_i - \mu_x)(y_i - \mu_y)}{\sqrt{\sum_i (x_i - \mu_x)^2} \sqrt{\sum_i (y_i - \mu_y)^2}}$$

$$\text{MSE}(x, y) = \frac{1}{M} \sum_i (x_i - y_i)^2$$

# Caveats

- Sampling bias due to the extremely sparse distribution of the selected samples in the image space
  - i.e., the curse of dimensionality
- Algorithmic bias due to potentially overfitting the selected samples
  - The dataset creation precedes the algorithm development
- Subjective bias due to potentially cherry-picking test results

# The Perception-Distortion Tradeoff

# Perceptual Image Restoration

- The invention of Generative Adversarial Networks (GANs) greatly improves the perceptual performance

Ground Truth

Less distortion  
PSNR-oriented

Photo-realistic  
GAN-based

# Gap Between IQA Metric and Human Judgment

- Increasing inconsistency between high numerical performances (PSNR, SSIM, PI, etc.) and perceptual performance.

Ground Truth  
PSNR / SSIM

PSNR-oriented

GAN-based

# Gap Between IQA Metric and Human Judgment

- Before 2018, Evaluation Using PSNR/SSIM

Ground Truth  
PSNR / SSIM

23.52 / 0.7056  
Good in PSNR, SSIM

19.86 / 0.5530  
Preferred by Human

# Gap Between IQA Metric and Human Judgment

- After 2018, Evaluation Using PI/NIQE

Ground Truth  
PI / NIQE

3.80 / 6.47  
Good in PI, NIQE

4.30 / 6.90  
Preferred by Human

# The Perception-Distortion Tradeoff

- How to evaluate image restoration methods?
- Distortion and perceptual quality are at odds with each other.
- The lower the distortion of an algorithm, the more its distribution must deviate from the statistics of natural scenes.

# What Makes a Great Picture?

# Image Quality vs. Image Aesthetics

- Quality assessment deals with measuring low-level degradations such as noise, blur, compression artifacts, etc.
- Aesthetic prediction quantifies semantic level characteristics associated with emotions and beauty in images.

# Photography 101: the where and when

- Composition

- Framing
- Rule of Thirds
- Leading Lines
- Textures and Patterns
- Simplicity

- Lighting

- Light Direction
- Color coordination / balance
- Sunny vs. cloudy
- “Golden Hour”
- B&W to focus attention
- (sur) realism

# Framing

“Photography is all about framing. We see a subject -- and we put a frame around it. Essentially, that is photography when all is said and done.”

-- from [photo.blorge.com](http://photo.blorge.com)

# Frame serves several purposes:

- 1. It gives the image depth
- 2. If used correctly, framing can draw the eye of the viewer of an interest to a particular part of the scene.
- 3. Framing can bring a sense of organization or containment to an image.
- 4. Framing can add context to a shot.

# Examples of nice framing

<http://flickr.com/photos/paulosacramento/226545698/>
