## Indexing anchor text

- Anchor text is often a better description of a page's content than the page itself.
- Anchor text can be weighted more highly than the text on the page.
- A Google bomb is a search with "bad" results due to maliciously manipulated anchor text.
- [dangerous cult] on Google, Bing, Yahoo

## PageRank

- Model: a web surfer doing a random walk on the web
- Formalization: Markov chain
- PageRank is the long-term visit rate of the random surfer or the steady-state distribution.
- Need teleportation to ensure well-defined PageRank
- Power method to compute PageRank
- PageRank is the principal left eigenvector of the transition probability matrix.

PageRank vector $=\vec{\pi}=\left(\pi_{1}, \pi_{2}\right)=(0.25,0.75)$

$$
\begin{aligned}
& P_{t}\left(d_{1}\right)=P_{t-1}\left(d_{1}\right) * P_{11}+P_{t-1}\left(d_{2}\right) * P_{21} \\
& P_{t}\left(d_{2}\right)=P_{t-1}\left(d_{1}\right) * P_{12}+P_{t-1}\left(d_{2}\right) * P_{22}
\end{aligned}
$$

## HITS: Hubs and authorities

## HITS update rules

- A: link matrix
- $\vec{h}$ : vector of hub scores
- $\vec{a}$ : vector of authority scores
- HITS algorithm:
- Compute $\vec{h}=A \vec{a}$
- Compute $\vec{a}=A^{T} \vec{h}$
- Iterate until convergence
- Output (i) list of hubs ranked according to hub score and (ii) list of authorities ranked according to authority score

## Why we use LSI in information retrieval

## Why we use LSI in information retrieval

- LSI takes documents that are semantically similar (= talk about the same topics), ...
- ... but are not similar in the vector space (because they use different words) ...
- ... and re-represents them in a reduced vector space ...
- ... in which they have higher similarity.

Why LSI can be viewed as soft clustering

## Why LSI can be viewed as soft clustering

- Each of the $k$ dimensions of the reduced space is one cluster.

## Why LSI can be viewed as soft clustering

- Each of the $k$ dimensions of the reduced space is one cluster.
- If the value of the LSI representation of document $d$ on dimension $k$ is $x$, then $x$ is the soft membership of $d$ in topic k.
